Performance of the first T2K-TPC

J. Beucher

IRFU / SPP

On behalf T2K/TPC group:

Canada	University of British Columbia, University of Victoria, TRIUMF
France	IRFU-CEA Saclay , LPNHE Paris-VI-VII universities
Germany	RWTH Aachen University
Italy	INFN/Bari
Spain	UAB/IFAE University of Barcelona University of Valencia
Switzerland	CERN/TS-DEM-PMT, DPNC/University of Geneva

Outline

- Introduction
- T2K-TPC
- Readout endplate
- TPC test and performance
- Conclusion

The T2K experiment

Super-Kamiokande
Cerenkov detector

A long baseline neutrino oscillation experiment

- Intense ν_μ beam with 650 MeV/c energy mean for neutrino oscillation study
- Main goals

➤ Direct search for $\nu_\mu \rightarrow \nu_e$ appearance (θ_{13})

- $\sin^2 2\theta_{13} < 7 \cdot 10^{-3}$ (90% CL) expected for T2K ($5 \cdot 10^{21}$ POT)

➤ ν_μ disappearance \rightarrow to improve “atmospheric” oscillation parameters measurement

$$\delta(\sin^2 2\theta_{23}) \approx 0.01 \quad \delta(\Delta m^2_{23}) \approx 3 \cdot 10^{-5} eV$$

The near detector ND280

A magnetized detector to:

- Measure energy spectrum and fluxes for ν_μ and ν_e prior to oscillation
- Determination of ν interaction cross-section

TPCs:

- Measure charge and momentum of charged particles
- Particle identification to distinguish e , μ , π and p
- Excellent pattern recognition

T2K/TPC outline

Performance requirements:

- **dE/dx resolution < 10 %** to perform e/ μ separation
- Momentum measurement with resolution $\delta p/p < 10\%$ @ $p \approx 1\text{GeV}/c$
 - High segmentation
 - Good spatial resolution

TPC readout design:

- Sampling length ~ 70 cm
- Pad size ~ 70 mm²
- **MICROMEGAS** as amplification device

Gas choice:

- Ar/iC₄H₁₀/CF₄ (95/2/3)
 - Fast gas mixture $v_d \approx 7.8$ cm/ μs @ 280 V/cm \rightarrow to avoid electron attachment
 - Low transverse diffusion $C_T \approx 270$ $\mu\text{m}/\sqrt{\text{cm}}$ @ 0.2 T \rightarrow good spatial resolution

TPC field cage

Momentum bias to be controlled better than 2%:

- Track distortion to be understood within $\sim 100 \mu\text{m}$, requires:
 - Small electric field distortion ($<10^{-4}$ level)
 - Careful consideration on field cage design and mechanicals (it's not a simply box !!!)
 - Mechanical tolerance for machining and assembly $\sim 100 \mu\text{m}$
 - Design takes care about deflection due to over pressure $<1\text{mBar}$

connects strips on adjacent panels

Field cage strip cut

Inner box assembly

Laser calibration system

- Al targets on the central cathode illuminated by UV laser light:
 - **Field distortion calibration** (in situ)
 - Electron drift velocity (V_d)

Bulk-MICROME GAS (T2K design)

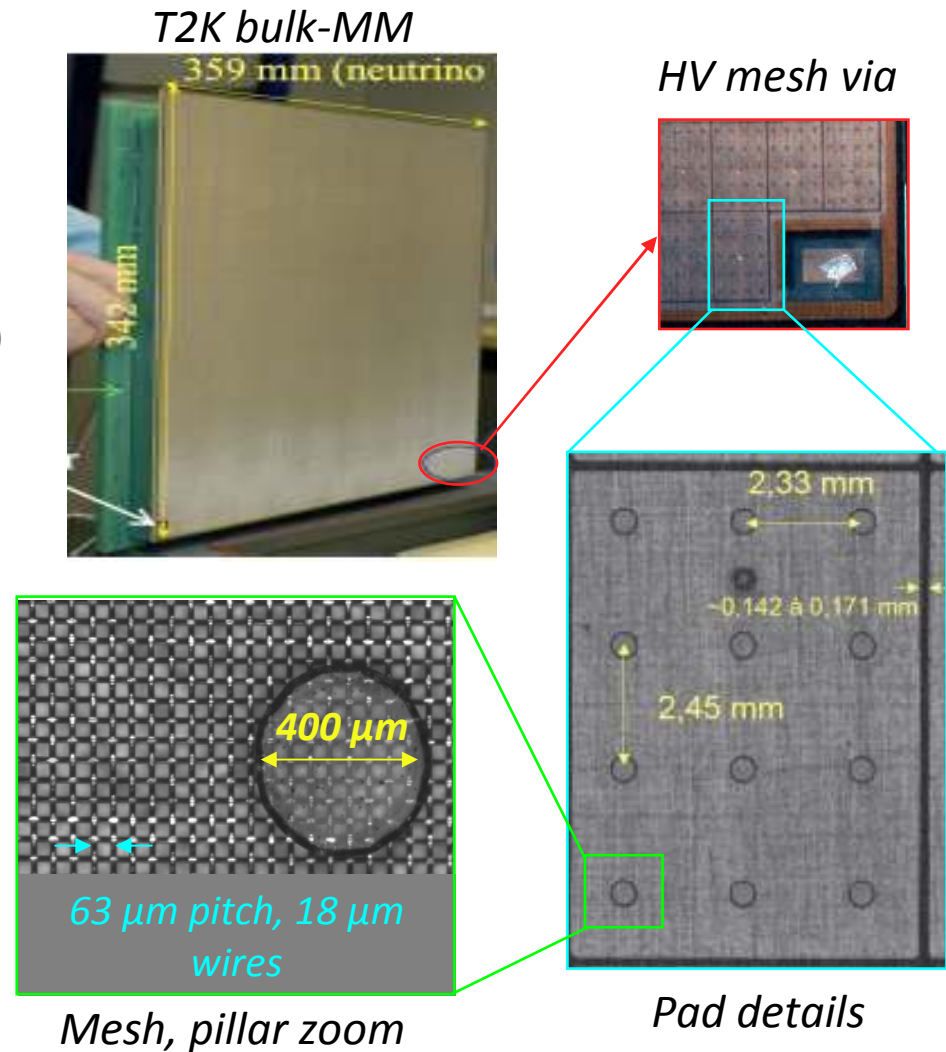

Bulk-MICROME GAS characteristics:

- all-in-one detector \rightarrow *anode + mesh*:
 - Simple design, robust and cheap
 - Massive production
 - Good uniformity
 - Minimized blind areas (edges, corners)
- Saclay design and production by CERN/TS-DEM-PMT

T2K bulk-MM:

- 128 μm amplification gap
- Large surface **34x36 cm²**
- **1726** active pads (6.9 x 9.7 mm²)
- 48 rows, 36 columns of pads
- 12 MICROME GAS detectors per plan
- **72 MM** for 3 TPCs
- Total equivalent surface about **9 m²**

\rightarrow First large size MPGD based TPCs

Front-end electronics

124 272 pads to readout:

- AFTER chip based electronics
 - 72 channels x 511 analog memory cells
 - 72-to-1 data concentration
 - Charge range (120 -> 600 fC) adjustable
 - Programmable peaking-time (100 ns -> 2 μ s, 16 values)
 - M.I.P. / noise ratio : 100
 - Power consumption per channel : 7 mW
- 6 FECs per MM module + 1 FEM

Front-End Card (FEC)

Front-End Mezzanine Card (FEM)

MICROME GAS test and calibration

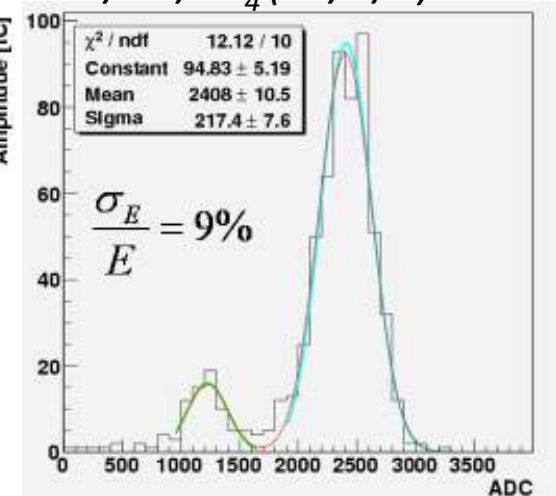

(X, Y) ^{55}Fe scanning:

Response uniformity

Ar/iso/CF₄ (95/2/3)

- Quality control check
 - Faulty pads
 - Edge effect
- Characterization and calibration pad per pad
 - Energy resolution measurement @ 5.9 keV
 - Gas gain as function of V_{mesh}
 - Gain and resolution uniformity @ nominal gain ($G \sim 1500$, $V_{\text{mesh}} = -350 \text{ V}$)

MM production summary

Amplitude dispersion (RMS)

Energy resolution (sigma)

Status:

- ~75% of production completed → 61 MM tested
- 3 rejected modules (35nA current, broken, low gain on 100 pads)
- ~10 faulty pads

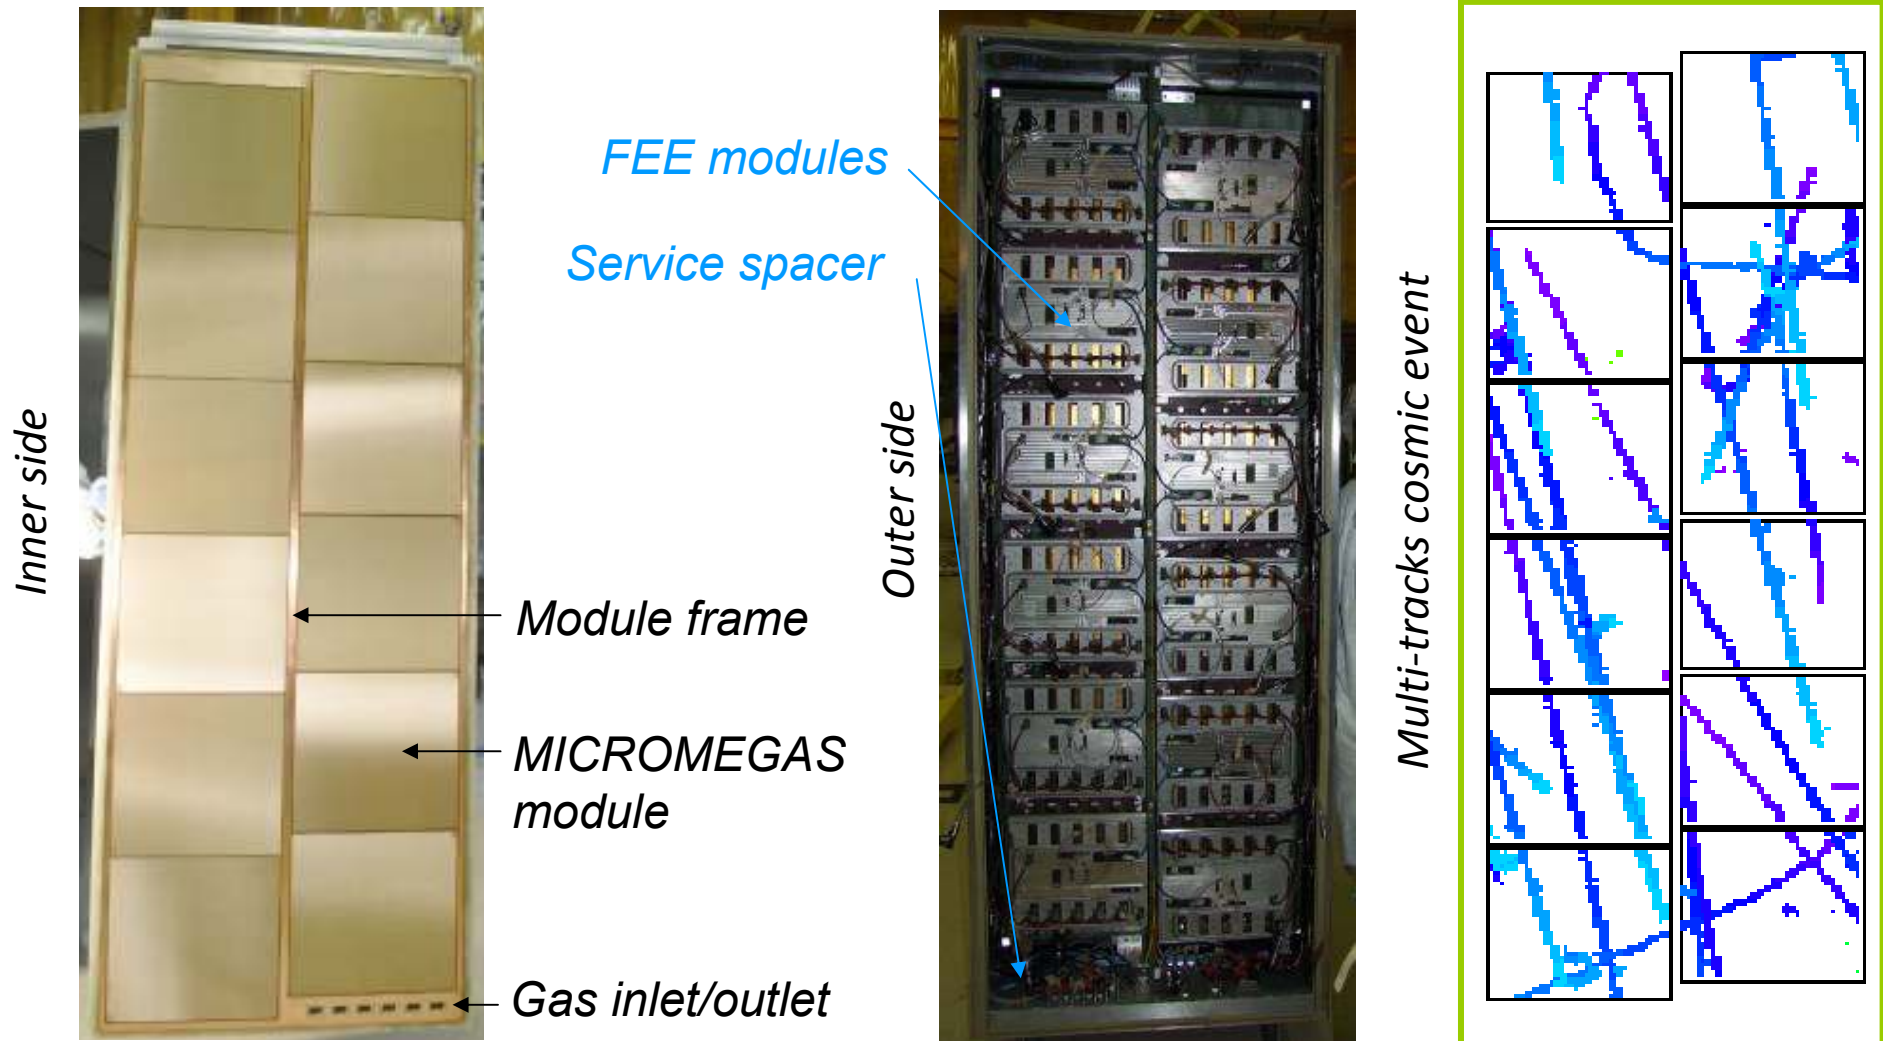

Performance:

- **Good gas gain uniformity** → dispersion $\approx 3\%$ over all MM surface
- **No edge effect**
- **Good energy resolution** @5.9 keV → $\sim 9\%$ (σ_E/E)
- Sparking rate: 0.1 h^{-1} and per MM @ $V_{\text{mesh}} = -350 \text{ V}$

Readout endplate

First T2K-TPC module completed, tested and ready to be sent to Japan

Tests @ TRIUMF

M11 area (TRIUMF, Vancouver):

- Beam test : e, p, π and μ up to 450 MeV/c
- Cosmic ray test

- Complete system test
 - HV system
 - Gas
 - Electronics
 - Cooling
 - Slow control
 - Laser calibration system
 - TPC box
 - O_2 level < 5 ppm
 - H_2O level < 15 ppm

- First test TPC+FGD
 - Track reconstruction
 - Input for ND280 software check

Cosmic trigger

Gas system

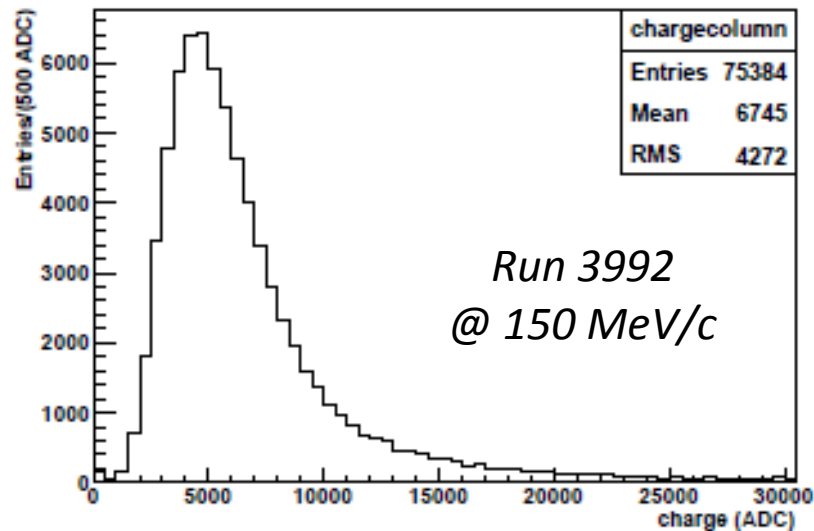

Beam trigger and
Time Of Flight
system

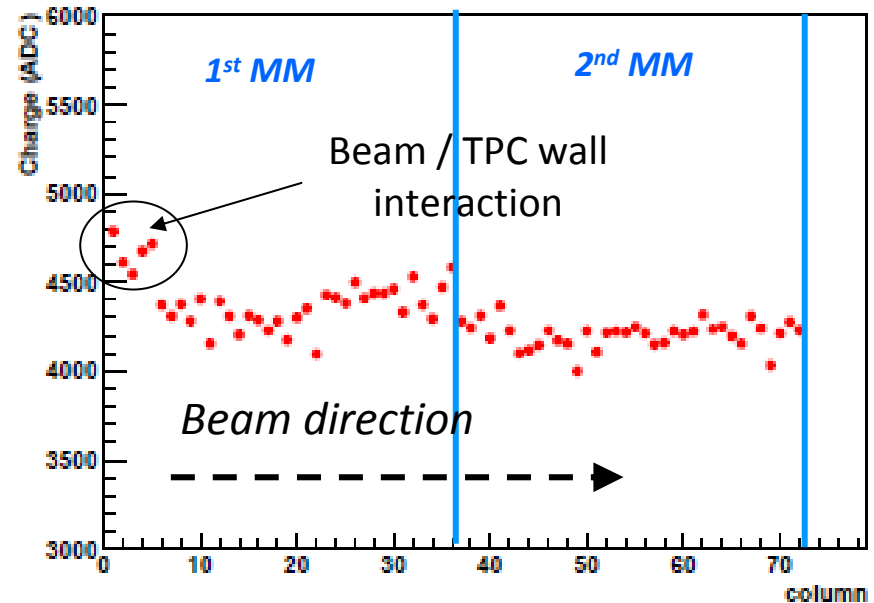

Charge measurement

Cluster charge distribution

MPV from Landau fit VS pad column

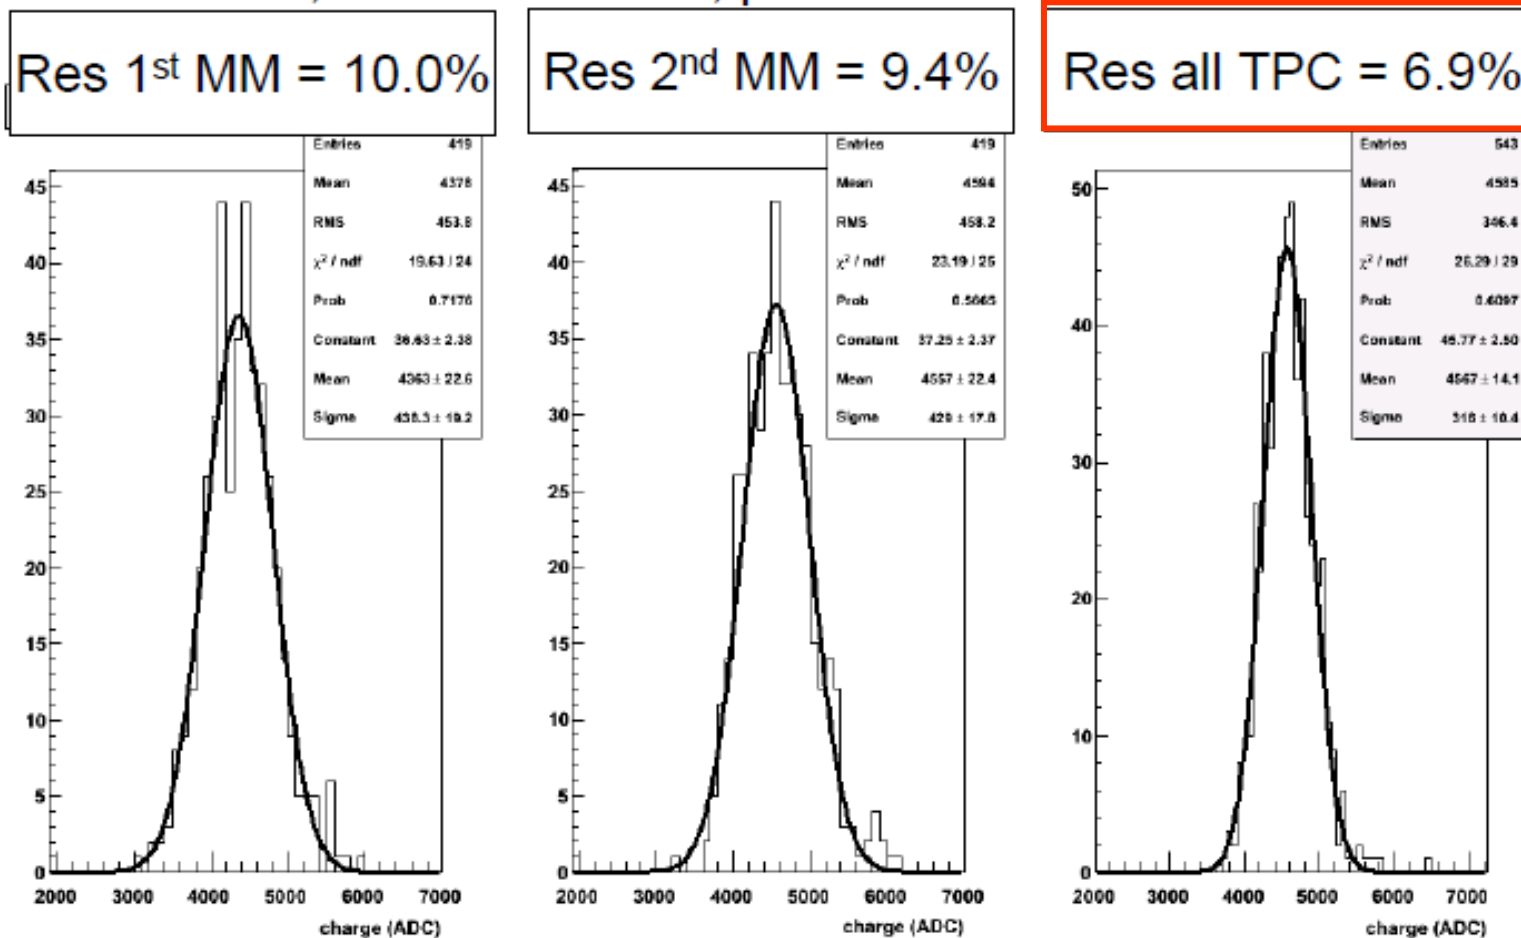

- Clustering method:
 - Time and space correlation by column
 - Typical number of pads per cluster: 2 or 3 pads
- dE/dx method:
 - 72 clusters
 - Truncated mean computed track by track
 - Truncated fraction of 70%

dE/dx resolution

- dE/dx resolution $\sim 7\%$ for μ @ 150 MeV/c and $V_{MM} = -350$ V extracted from truncated mean (truncated fraction used: 70% over 72 samples)

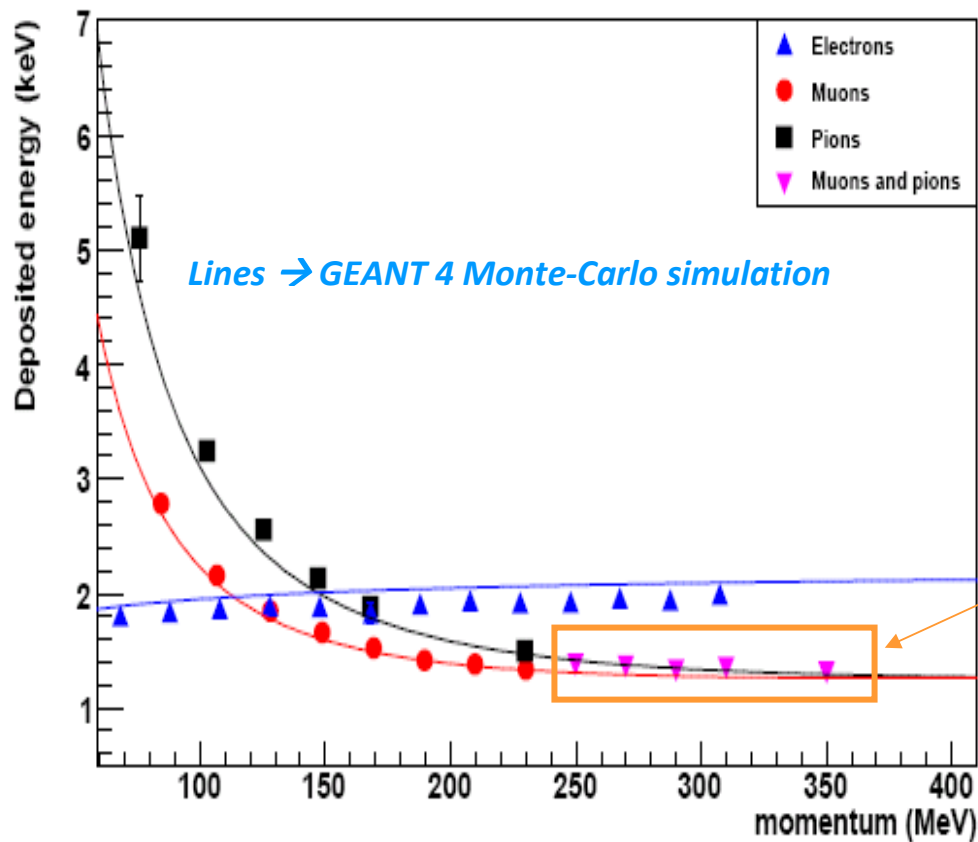

2 MM

e/ μ separation capability

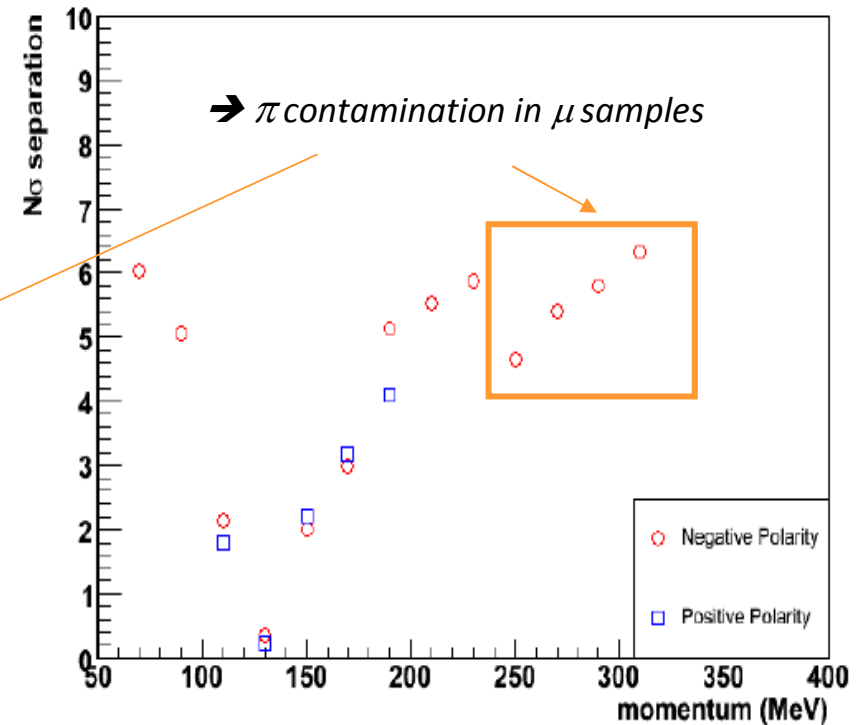

Deposited energy vs momentum

- e/ μ separation $> 5 \sigma$ for particle momentum > 200 MeV/c

$$N\sigma = \frac{|CT_{\mu} - CT_e|}{\sigma_{\mu}}$$

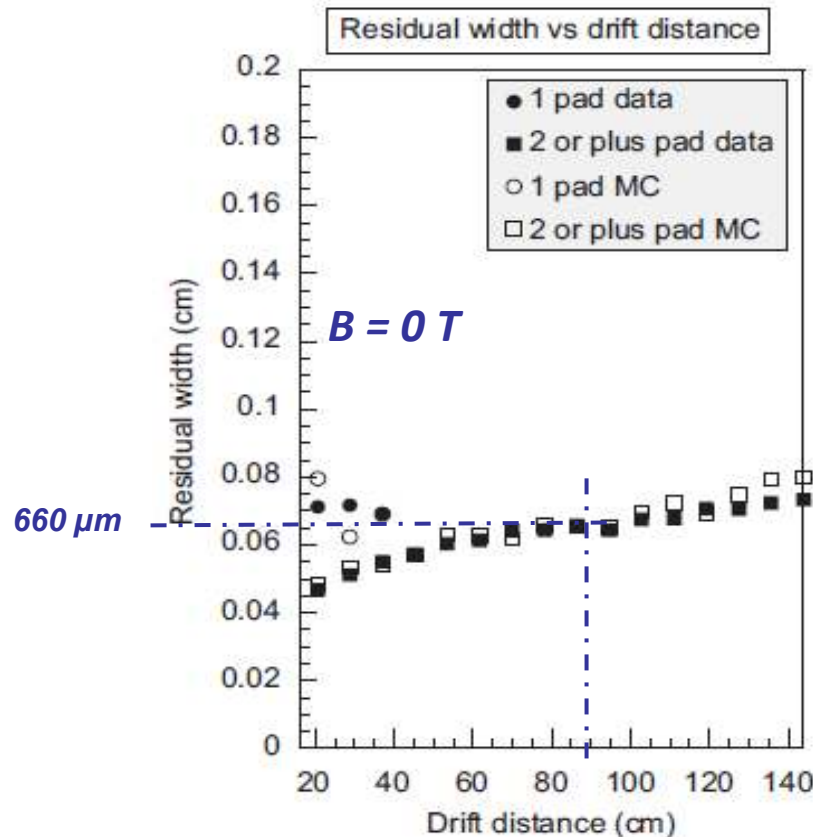

Electron/Muon separation

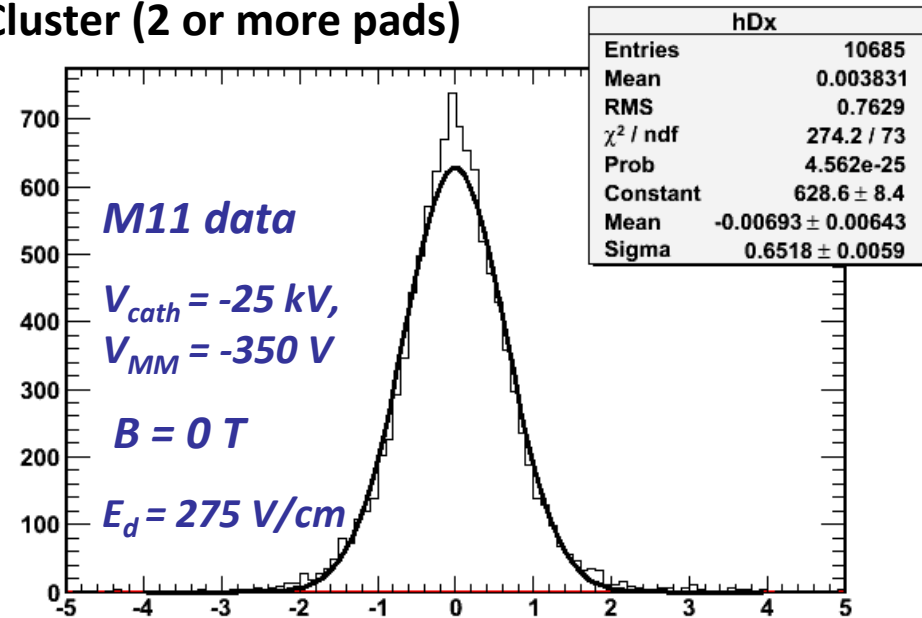

Spatial resolution from M11 data

HARP Test (T2K MM prototypes):

First TPC @ M11 (TRIUMF):

Residual distribution
Cluster (2 or more pads)

- Spatial resolution 650 μm measured @ 76 cm drift distance
 - Compatible with previous results obtained with prototypes
 - Sufficient to meet momentum resolution goals

Future schedule

- Maintain m11 data analysis effort (distortion fine analysis)
- 2nd TPC is completed and is ready for mounting FEE
 - this week
- Beam test for 2nd TPC
 - this month
- 3rd TPC construction and assembly is ongoing
- Installation of the two first TPCs at the ND280 site
 - begin this summer
- Commissioning phase for the two first TPCs
 - in fall 2009
- Installation of the 3rd TPC at the ND280 site
 - Dec. 2009
- Start neutrino data taking, → Dec. 2009 / Jan. 2010

Conclusion

- The T2K TPCs are the **first large TPCs** dedicated to HEP experiment **using MPGD as amplification device**
- Production and validation of bulk-MICROMEGAS are **almost completed** (61/80 done in one year)
- Excellent uniformity and good energy resolution for bulk-MICROMEGAS modules
- **First TPC module successfully tested**
- Performance goals met (**7% dE/dx resolution** and **~650 μm spatial resolution** were measured at TRIUMF facility)
- Full system **successfully tested**

Much work ahead for our group to bring the 3 TPCs into full operation in Japan by the end of the year
