¹Dept. of Engineering Physics, Tsinghua University, China

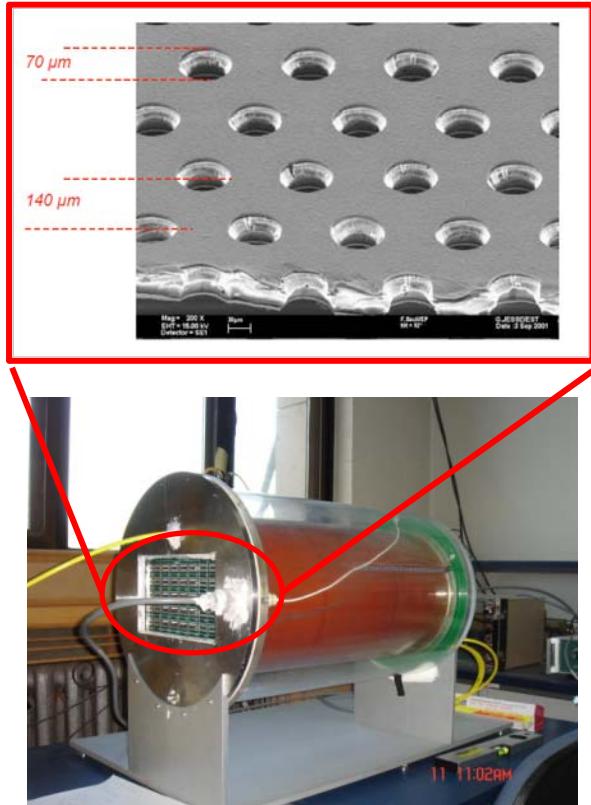

²Nuctech Co. Ltd, Beijing, China

³Institute of Microelectronics, Tsinghua University, China

Introduction

- *What's the Requirements*
 - TPC vs. X-ray Imaging
 - Two Readout Schemes
 - CASA/Waveform Sampling/DSP
 - Switched FET Array
 - Summary
-

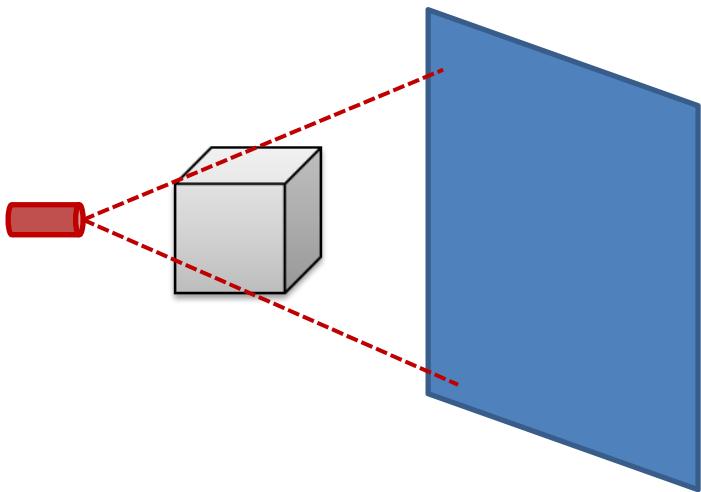

GEM based Time Projection Chamber

GEM-TPC @ Tsinghua

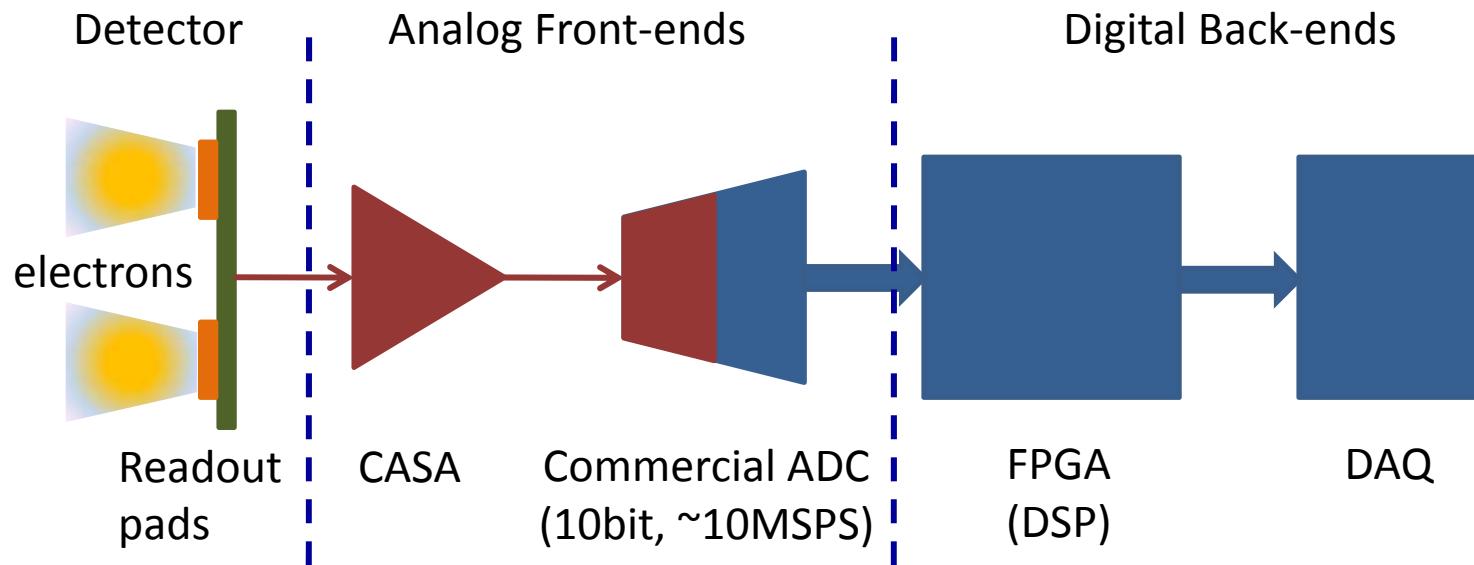

- Measurement of ion particle tracks in 3D
- Single particle detection
- Amplitude and timing needed
- $1\sim10$ channels/cm²

X-Ray Imaging

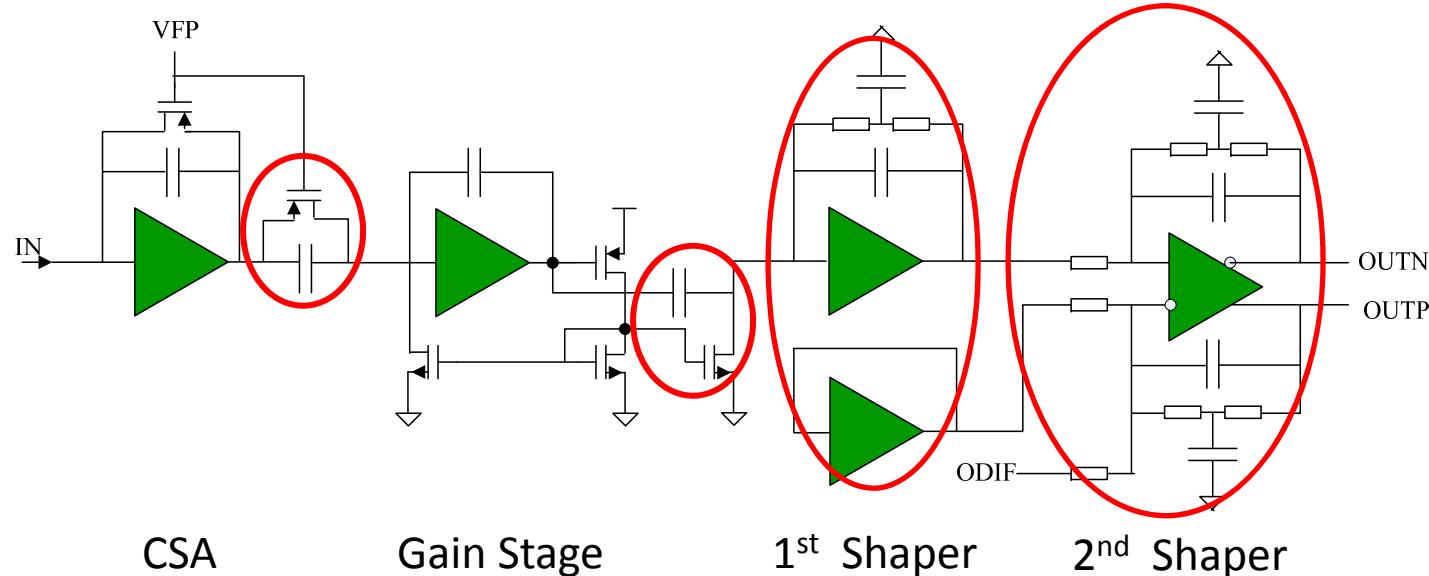

- 10~100keV photons
 - Integration or photon counting
 - Only amplitude needed
 - 1~100 channels/cm²
-

Readout Electronics for Particle Tracking

CASA: the Front-end ASIC

Variable value of C, giving different charge gain, together with matched size of the MOS transistor

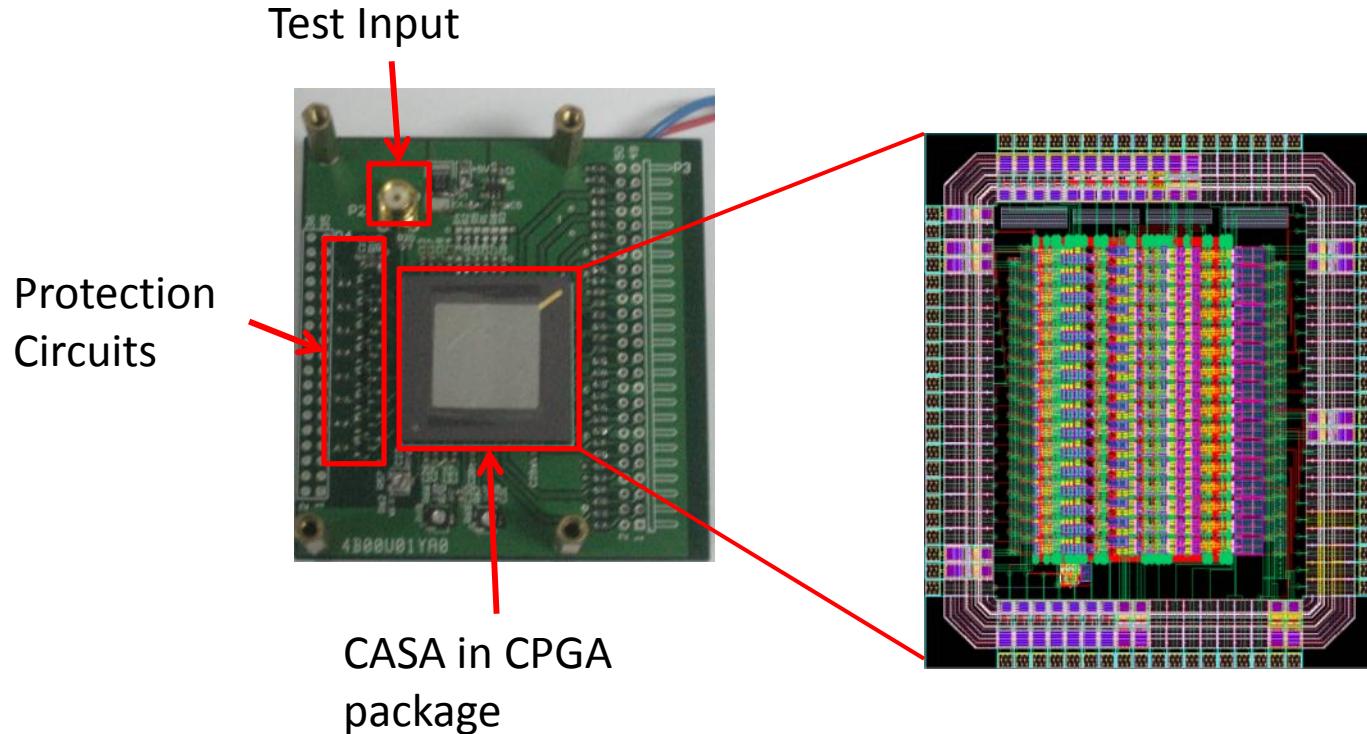

A dummy shaper amplifier, transfer signals to differential

A fully differential amplifier, with class-AB output stage

Specifications

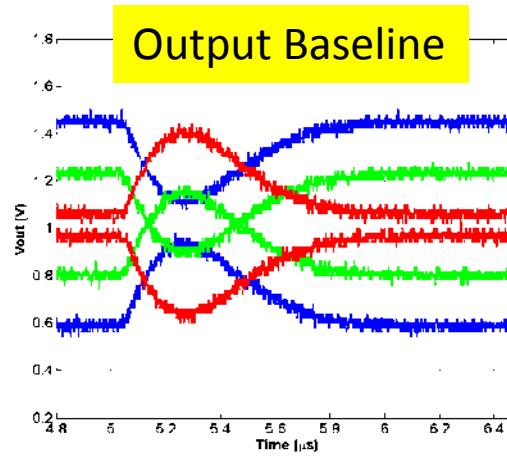

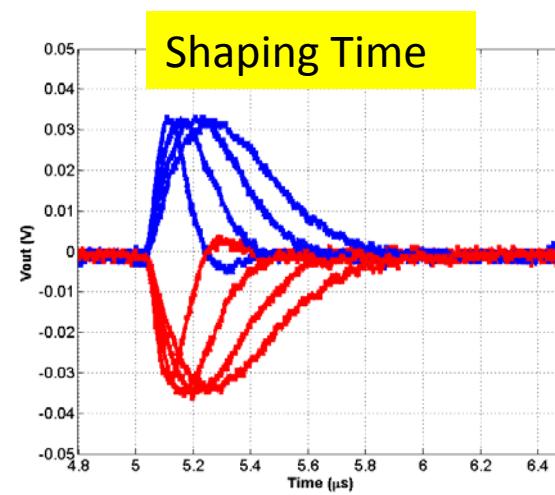

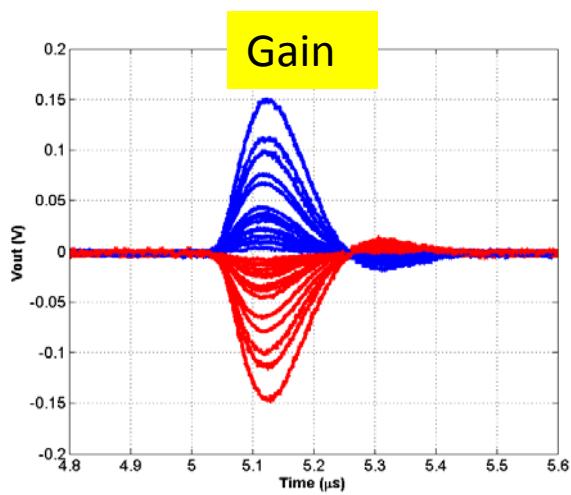

Input Charge	10-1500fC
SNR for MIP	>20:1
Gain (Differential)	1-28mV/fC, adjustable
Shaping Time (t)	25-100ns, adjustable
Output Swing	2 V p-p, differential
Drive Load	10pF
Crosstalk	<1%
Power Consumption	<10mW/ch

Front-End Board

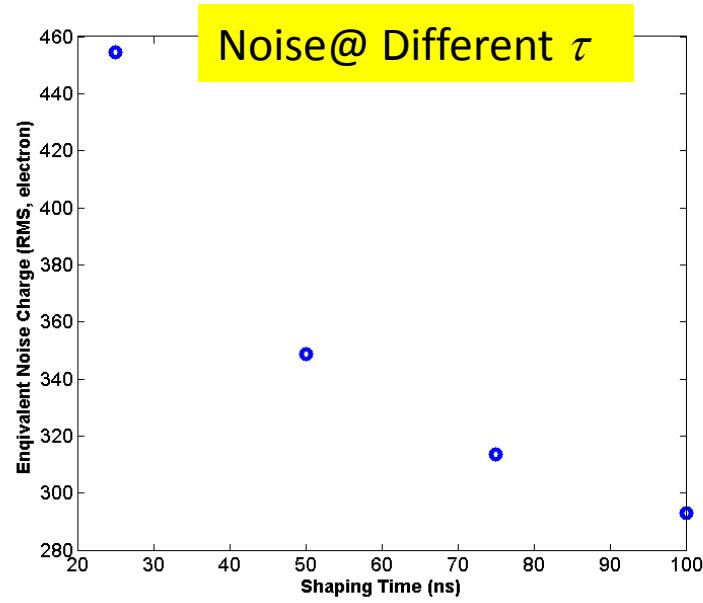

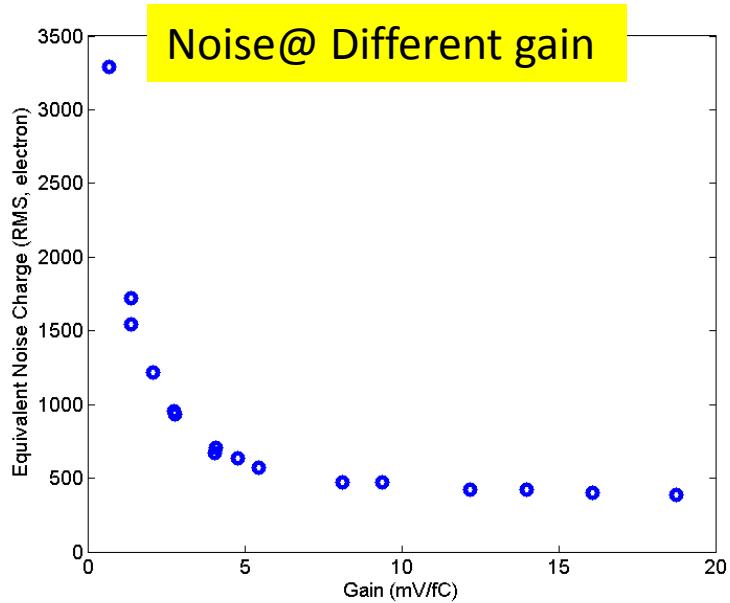

Power: 8.9 mW/ch
Crosstalk: <0.98%

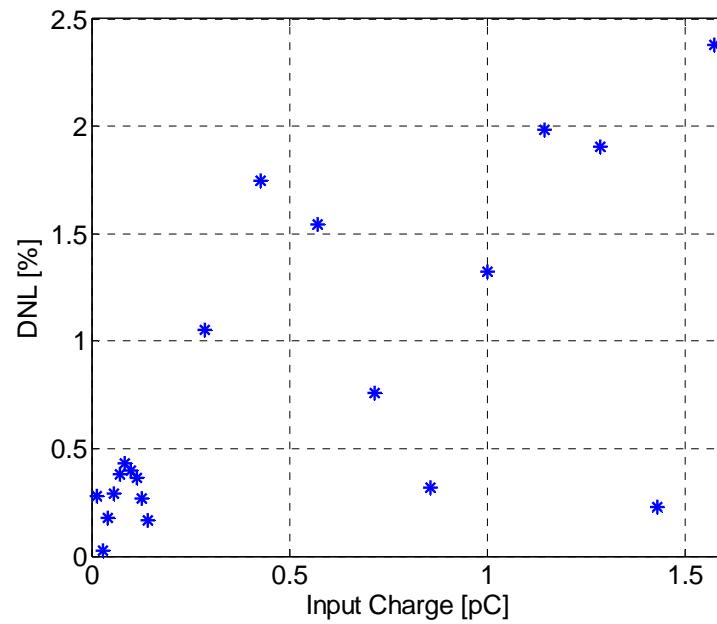

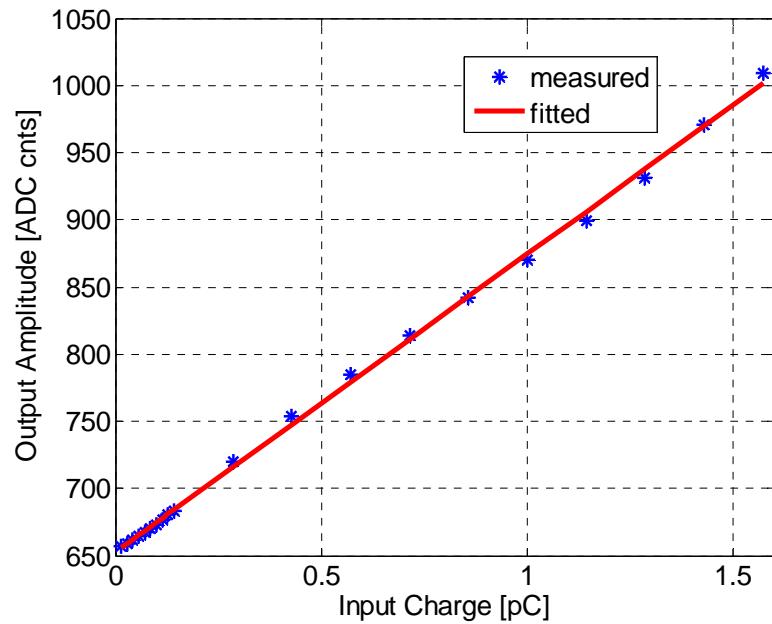

Programmability

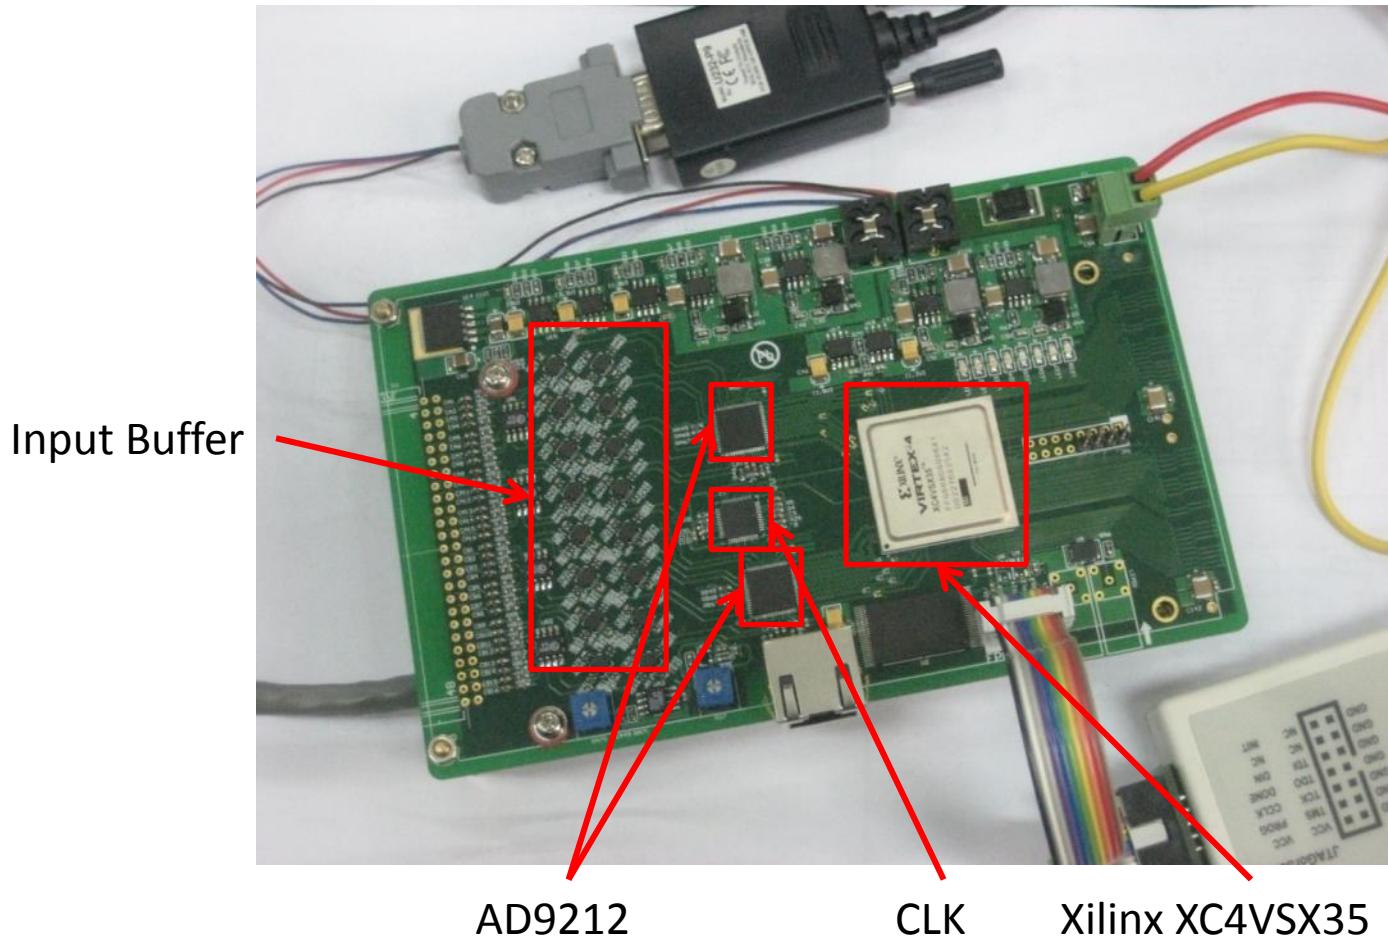

Noise Performance

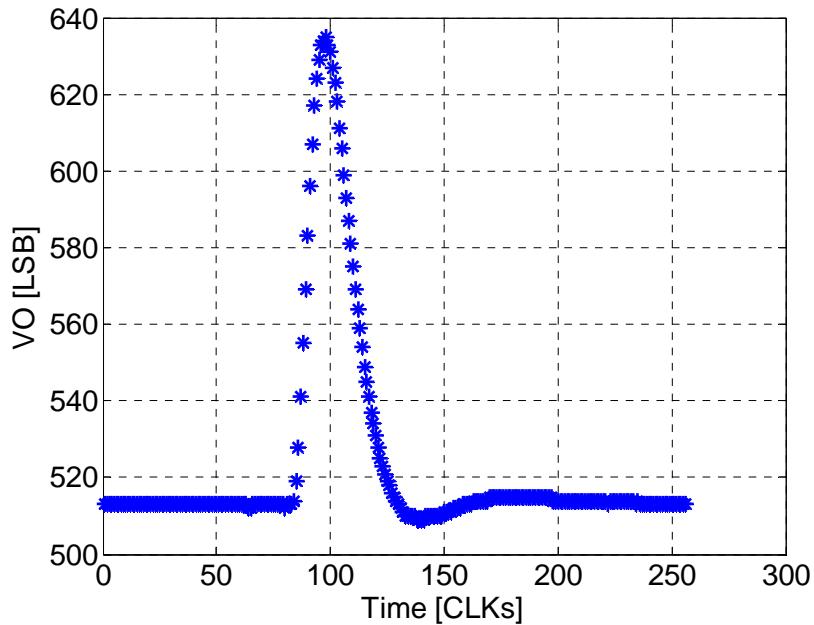

Linearity

Sampling and DSP Board

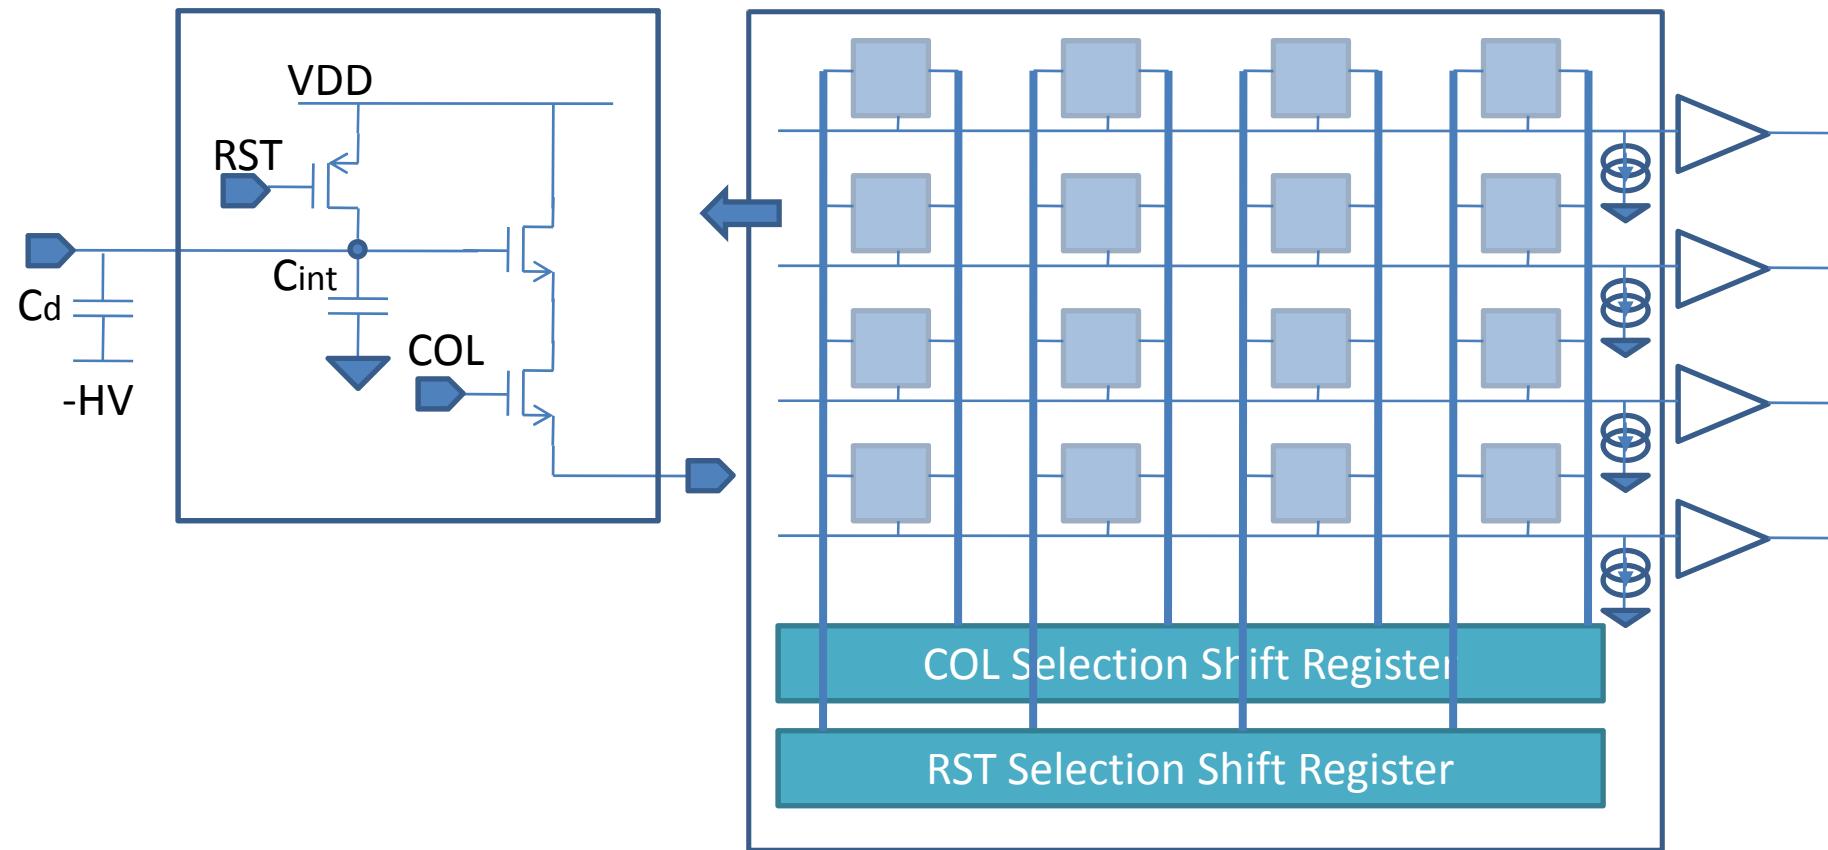

Sampled Waveform

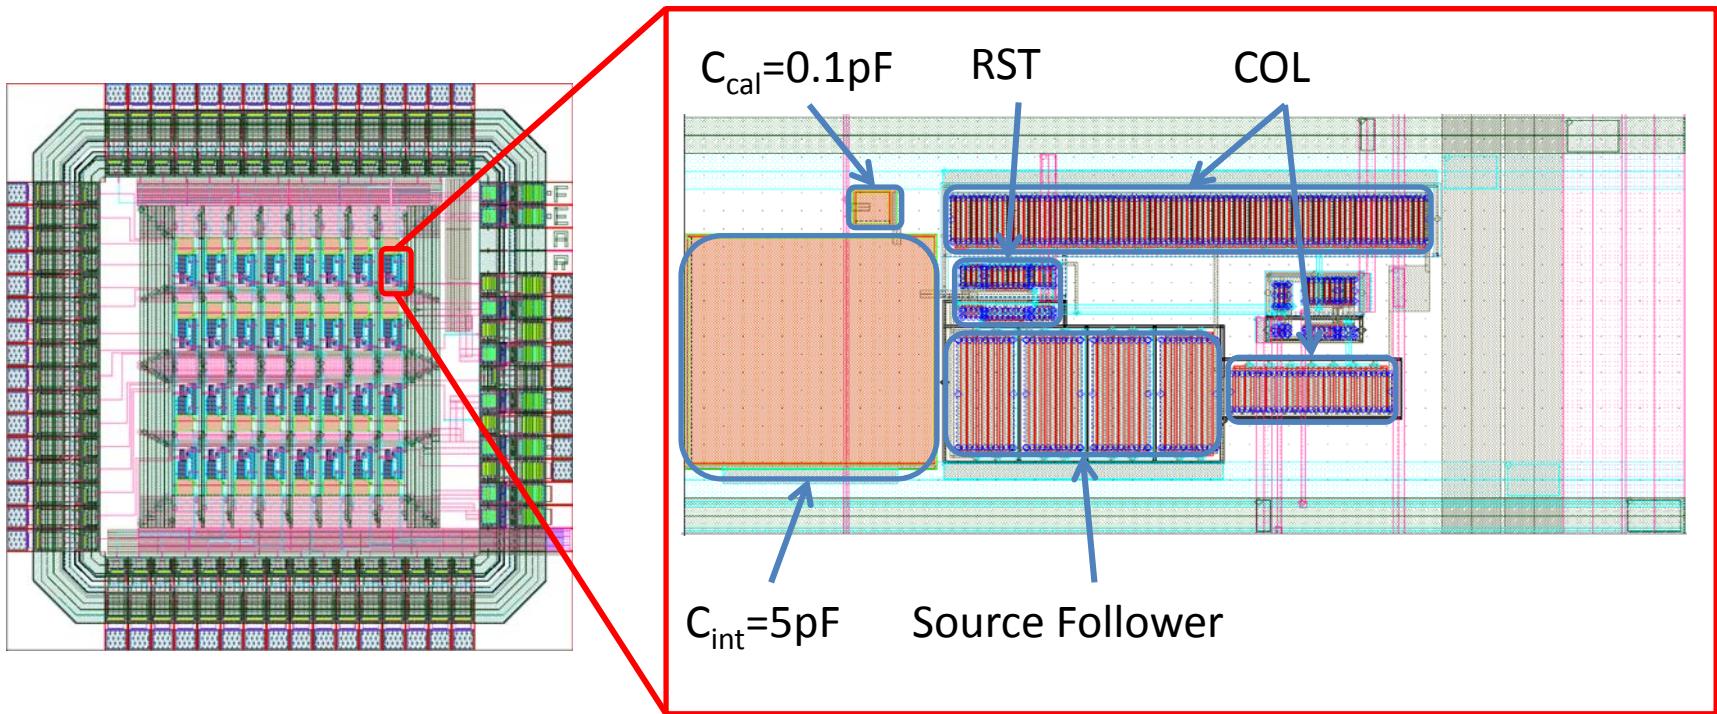

- Sampling @ 10bit 40MSPS
 - Two level buffers:
Latency buffer and Derandomize buffer
 - 1000Mbps data output rate via Ethernet
-

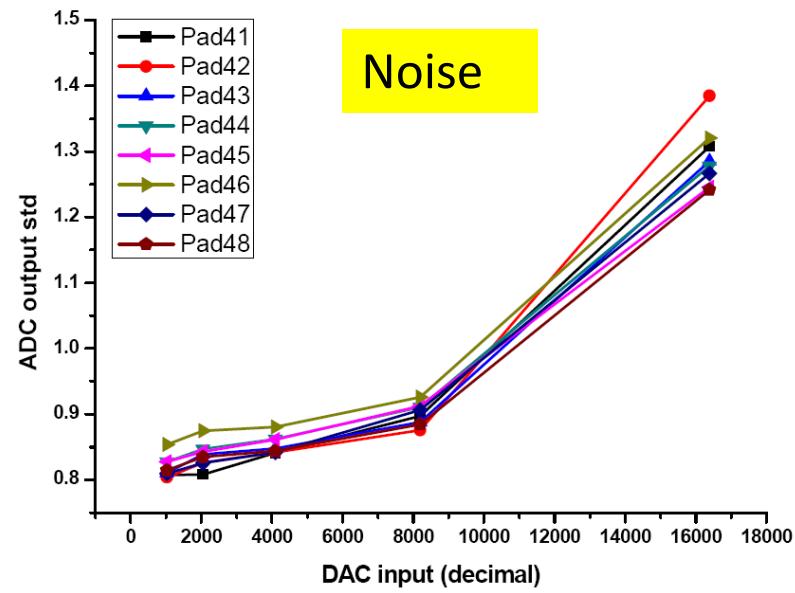

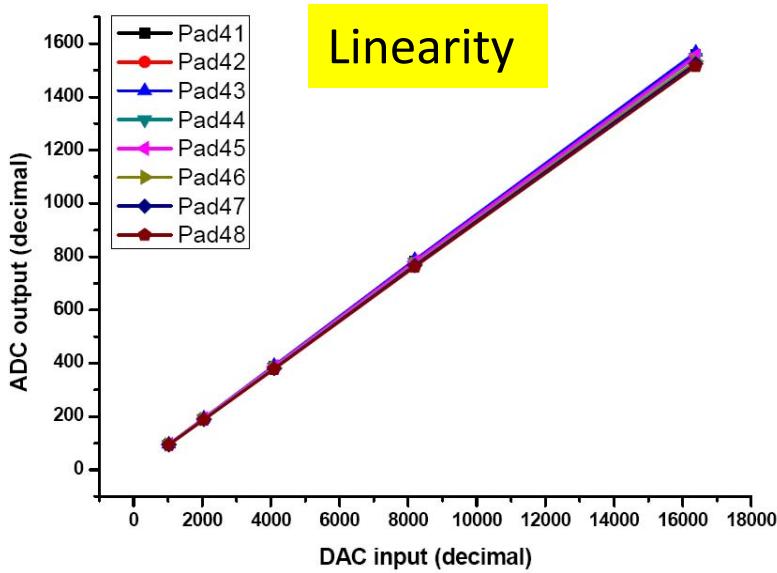

FEAR: FET Array Readout

Layout

Preliminary Test Results

Summary & Future Work

- Two different readout electronics system for GEM detector are developed for particle tracking and X-ray imaging
- Two frontend ASICs, named CASA and FEAR are designed and tested
- Further tests with detectors and dedicated DSP filter design are undergoing
