

LArIAT Liquid Argon TPC in a Test Beam

Data Acquisition and Trigger

William Badgett Fermi National Accelerator Laboratory Kirk & Wilson Roads, PO 500, MS 309 Batavia, IL 60510 U.S.A.

> on behalf of The LArIAT Collaboration

at the 2016 Conference of Computing in High Energy Physics San Francisco, CA U.S.A.

> Online Computing Track 1.5, Contribution 546 Wednesday October 12, 2016

Cryostat in beam line

- Repurposed ArgoNeut cryostat and time projection chamber TPC
- Tertiary beam from the Fermilab Main Injector, historic MCenter beam line
- Many species: $\mu \pi \gamma e p K$
- Momentum range from 0.2 GeV to 1.5 GeV
- Answer the question: How to identify particles in liquid argon?
- Unlike in v beams, we ID the particle prior to entering the detector and cross reference in the TPC
- Nuclear cross sections & more
- Data taking 2015, 2016, 2017...

TPC, before installation

Fermilab The LArIAT Time Projection Chamber

- Two 60° sense wire planes give 2 spatial coordinates
- Drift time gives third
- dimension 3D tracks
- 480 sense wires
- 25 *kV* Cathode plane
- 500 V/cm E field
- 350µs max electron drift time
- Cold preamps yield improved S/N ~ 70:1
- Digitization in the warm, 12 bits every 128 ns (variable)

DAQ: Top View of Detector Elements

Beam and DAQ+Trigger Timing

Fermilab

- Have 4.2 second window beam spill + up to 50 seconds collection cosmic rays every 60.5 second super cycle
- *Cannot* read every sample without custom readout hardware and \$\$\$
- Must have triggered system handle ~ 100 200 triggers/spill
 - ~ 3 Mb data per trigger, TPC data alone
- TPC Data volume dominates requirements
 - ~ 350 µsec max drift time, plus padding = 393 µsec
 - Ideally 128 nsec sample time, 256 nsec adequate, 512 ns if needed
 - 480 wires to readout, no zero suppression, two bytes per channel per sample (12 bit ADC)
- Found solution with CAEN V1740 64 channel wave form digitizer
 - High density 6U VME, single width need 8 cards
 - Required new "decimation" in firmware to slow 16 nsec to 128 nsec ...
 - Large buffers can store 64, 128, 256 events, depending on T width

‡ Fermilab

CAEN V1740 VME Crate

V1740 Crate prior to analog hookup Note daisy-chained digitizer clock Chained optical link for configuration and readout Common trigger and reset \$00 inputs from fanouts First board in chain provides master clock, downstream clocks phase adjusted to < 150 ps skew

V1740s constantly digitizing to circular buffer On receipt of trigger, copy buffer to memory location Ready immediately for subsequent trigger

‡ Fermilab

- Light collection (ToF, Aerogel, LCS) have much faster time scales
 - ~ 10's of nsec
 - $-2 \times$ CAEN V1751, eight channels each, 1 nsec sampling
 - Typical wave form width 28 μsec
 - Specially modified for 200 mV scale (single photo-electrons)
 - Read via CAEN CONET optical link to A3818 PCI bridge
 - For precision ToF hit timing use WUT Wave Union TDC, resolution ~ 15 psec
 - Read via VME via PCI bridge
- Wire Chambers with max drift ~ μsec
 - Use established Hansen readout supported by FTBF staff
 - Have 1.17 nsec granularity, independent clock
 - Multi-hit TDCs, four chambers, (x,y) (128,128) 1024 channels
 - Spill stored entirely in on-board buffers, collated to central controller
 - Read at end of spill by main Lariat DAQ over ethernet
- P TPC contra mundum
 - − Two very different time scales → fast and slow triggers!

WUT

Data Flow Diagram

Details of LArIAT DAQ Readout Data Flow Several external sources read and collated by single event builder "DAQ PC"

Data packaged per spill into artDAQ fragment and saved in art / LArSoft compatible root data files

- *"KISS"* Keep It Simple, Stupid!
- No Quixotic GUI developments, nunca!
- Configure system via human readable XML text files
 - One per subsystem, store entirety in data stream and LArIAT database every run in structured form
 - Easy to include, exclude components and tweak their setting
 - Expert access only, shifters do not access
- To start a run, simply type "go" at the prompt
 - Yes, it's really that easy!
- Display run status in a single easy-to-use web page
 - No, it doesn't really count as a GUI
- Use artDAQ framework to produce art and LArSoft compatible root file output
 - See J. Freeman's talk from Monday for artDAQ details
- Already reusing techniques, code, classes for SBND BNB experiment

LArIAT Run Status

Data Archiving

Fermilab <u>Challenge</u>: Cross-Detector Synchronization

CHALLENGE: Subsystems with separate acquisition clocks must be aligned in the data

Time matching between wire chambers and ToF PMTs Note *both* offset and slope corrections Stability improved with time, but still significant macroscope variations

Fermilab <u>Challenge</u>: Front End Configuration Upsets

Challenge: Search to Stamp Out noise

All detectors subject to various noise source – need fast, nimble tools to search and destroy: e.g. flexible pulse injection and wave form display

CAEN, LArIAT, D. Shooltz

- Several detectors means several possible trigger sources
- With long TPC time scale, fast light time scale:
 - Fast Trigger: Readout light, wire chamber, ToF, AeroGel (on V1751s), plus Wire Chambers' TDCs
 - Delayed Trigger: Readout TPC, one readout window later
 - Allows time to veto TPC readout in case of pile-up or halo, saves bandwidth
 - Also allows intra-drift trigger, e.g. Michel electrons, more info
- Need flexible, programmable trigger
 - Implement trigger logic and scalers on user-programmable CAEN V1495 VME based FPGA card
 - Think CDF Fred or CMS GL1T, unusual for test beam
 - Configurable and readable over VME bus
 - Serves as final logic for several crates of NIM logic discriminating many detector signals
 - Provides prescale function to reduce high rate triggers

M. Kordosky, M. Stephens, J. Zhu

V1495 Trigger Card

17

‡ Fermilab

16 Typical Trigger Inputs

Above inputs can be specific in up to 16 trigger output paths, required ON or OFF

Delayed trigger VETO uses same input logics with opposite logic

All logic stored in LArIAT database available for offline use

Input	Source	Input	Source	
WC1	Wire chamber up stream	HALO	Beam halo counters	
WC2	Wire chamber 2	PULSER	Hardware pulser, testing	
WC3	Wire chamber 3	COSMICON	Cosmic post-beam gate	
WCC *	Wire chamber majority logic	COSMIC	Cosmic paddles	
BEAMON	Spill beam gate	LARRY	Cosmic trigger with light	
USTOF	Upstream Time of Flight	MICHEL	Michel electron	
DSTOF	Downstream Time of Flight	LARSCINT	LAr scintillation light	
PUNCH	Punch-through counter	MURS	Muon Range Stack	

* WC exceptionally has majority logic, 3 / 4

Run 6373, near end of LArIAT Run 1 when things were quite stable With 866 spills, > 14 hour run

Path	Trigger Requirements ON	Required OFF
1	BEAMON+USTOF+DSTOF+WCC	
2	BEAMON+USTOF+DSTOF+WCC+PUNCH+MURS	
3	BEAMON+USTOF+DSTOF+WCC+PUNCH	-MURS
4	BEAMON+USTOF+DSTOF+WCC+MURS	-PUNCH
5	COSMIC	-BEAMON
6	LARRY	-BEAMON

The delayed trigger VETO function was not normally required but remains available for run 3 in 2017

Thanks!

Both physics and technical knowledge already benefiting future neutrino experiments Run 1 2015, Run 2 2016 Looking forward to run 3 in 2017 with new sense planes and more

> This talk represents hard work from many people on LArIAT

> LArIAT: The little detector with a big heart, out standing in the field

Backup Slides

LArIAT Readout Kernel

- Configuration and Readout factorized by C++ classes per subsystem, using OO inheritance to simplify coding
 - Each subsystem class outputs Lariat specific data fragments
- Main LariatReadout class conducts configuration and readout
 - Monitors triggers via interrupts and polling
 - Watches for spill status in order to cleanup and end and restart
- LArIAT kernel wrapped into ArtDaq Boardreader class
 - Lariat_generator extends LariatReadout
 - Wraps all Lariat specific fragments into one ArtDaq Fragment per spill
 - Converts raw binary to Root object readable by Art and LArSoft

LArIAT Data Fragments

Class names and contents, produced by LariatReadout, defined in shared online and offline package *LariatFragments*

V1740Fragment

- TPC wires' wave forms
- Trigger hit timing digital wave form
- Muon Range Stack

V1751Fragment

ToF, AeroGel, Light Collection (PMTs, SiPMS)

V1495Fragment

Trigger counters and configuration

TriggerFragment

Pipeline of all trigger input pattern, including time stamps

WUTFragment

High precision ToF hit times

TDCFragment

- Beam wire chambers' hit times

NB: At this level, each fragment is *asynchronous* to the others and time slicing takes place down stream (see later talk). At readout time, all fragments from one spill are concatenated into one ArtDaq Fragment. See backup slides for synchronization demonstration.

- Demand for online computing modest but critical
- One 8 core for configuration, readout, archiving
 - Install CAEN A3818 four channel optical bridge (large)
 - Locally cache at least one week of data (more in reality)
- One 8 core for *online* data quality monitoring
 - Need one minute feedback for beam and detector conditions
 - Redundant power, redundant disk (thanks, SLAM group!)
- Hot backups for each function
- Two thin gateways for access
- Strong firewall to access main DAQ, DQM per FNAL and DoE security requirements (unusual for test beam)

Simplified Trigger Logic

- 32 arbitrary external NIM inputs on the left
- Input latch and counters at 100 MHz imes 2
- 16 coïncidence logic units trigger paths
- OR of paths indicates fast trigger
- Delay, plus NOT VETO indicates delayed trigger
- Record triggers + times in FIFO for VME readout

Real Time Data Quality Monitoring

TPC pedestal mean and RMS

Pedestal mean on collection plane

As always, fast, real-time data quality monitoring (DQM) critical to successful experiment operations

As data are taken, raw data are *rsync*ed to dedicate DQM server from DAQ

Data are analyzed and plots produced, viewable in sophisticated web interface, example to the left

J. Ho
