Netfinder
Real Time Network Discovery Tool

Donato De Girolamo - INFN CNAF

CHEP2016, October 10-14 San Francisco, CA - USA
Netfinder is a **real-time network discovery** tool.

- Using *ICMP Echo Request* and *standard SNMP MIBs*, it reveals all network attached devices and how they are interconnected.

- It creates **Physical** and **Data-Link Network Maps on-the-fly**.

- During the discovery it detects which device acts as a *Router* for which VLAN-ID/Network: in this way it generate a **Routing Network Map**.

- *Netfinder* is capable to perform **Host Localization**: it locate in real-time where a single or multiple hosts are attached.

- All informations collected during the discovery are stored in a database for off-line access.

- Finally a web interface permits to make queries and visualize the results: **Graphical Network Maps** and **tabular summaries**.
