

# The Machine/Job Features mechanism

*Thursday, 13 October 2016 16:30 (15 minutes)*

Within the HEPiX virtualization group and the WLCG MJF Task Force, a mechanism has been developed which provides access to detailed information about the current host and the current job to the job itself. This allows user payloads to access meta information, independent of the current batch system or virtual machine model. The information can be accessed either locally via the filesystem on a worker node, or remotely via HTTP(S) from a webserver. This paper describes the final version of the specification from 2016 which was published as an HEP Software Foundation technical note, and the design of the implementations of this version for batch and virtual machine platforms. We discuss early experiences with these implementations and how they can be exploited by experiment frameworks.

## Tertiary Keyword (Optional)

## Secondary Keyword (Optional)

Distributed workload management

## Primary Keyword (Mandatory)

Computing middleware

**Primary author:** MCNAB, Andrew (University of Manchester)

**Co-authors:** SFILIGOI, Igor (University of California San Diego); KEIJSER, Jan Justinus; ALEF, Manfred (Karlsruhe Institute of Technology (KIT)); ROISER, Stefan (CERN); CASS, Tony (CERN); SCHWICKERATH, Ulrich (CERN)

**Session Classification:** Posters B / Break

**Track Classification:** Track 7: Middleware, Monitoring and Accounting
