

# Effective HTCondor-based monitoring system for CMS

## Abstract

The CMS experiment at LHC relies on HTCondor and glideinWMS as its primary batch and pilot-based Grid provisioning systems. Given the scale of the global queue in CMS, the operators found it increasingly difficult to monitor the pool to find problems and fix them. The operators had to rely on several different web pages, with several different levels of information, and sifting tirelessly through log files in order to monitor the pool completely. Therefore, coming up with a suitable monitoring system was one of the crucial items before the beginning of the LHC Run 2 to ensure early detection of issues and to give a good overview of the whole pool. Our new monitoring page utilizes the HTCondor ClassAd information to provide a complete picture of the whole submission infrastructure in CMS. The monitoring page includes useful information from HTCondor schedulers, central managers, the glideinWMS frontend, and factories. It also incorporates information about users and tasks making it easy for operators to provide support and debug issues.

## Implementation details

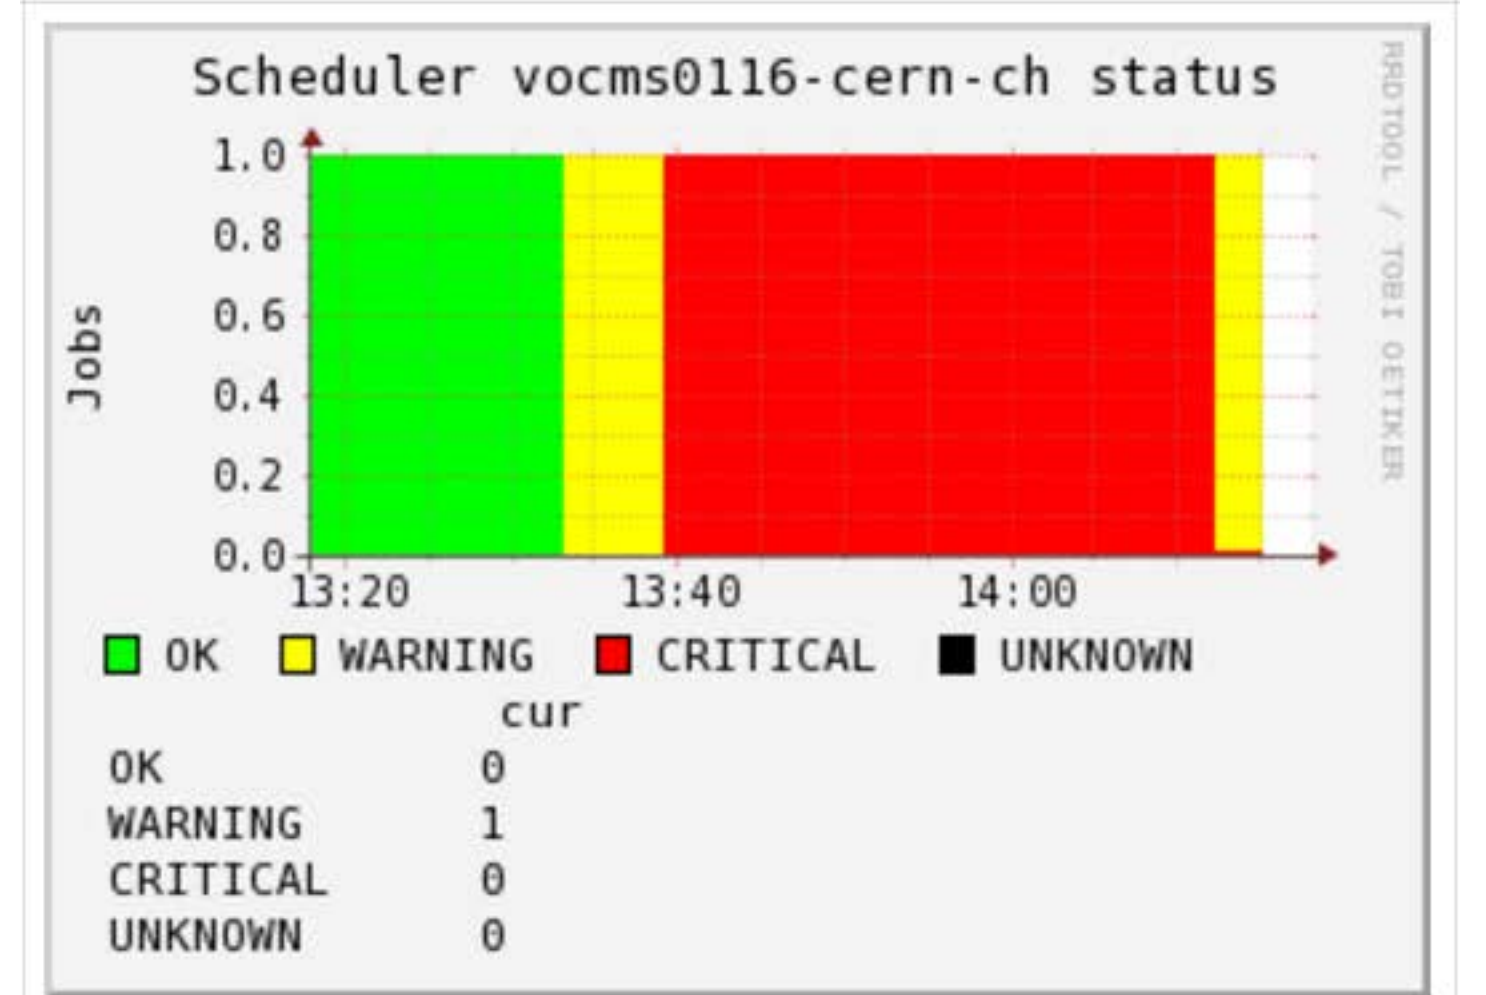

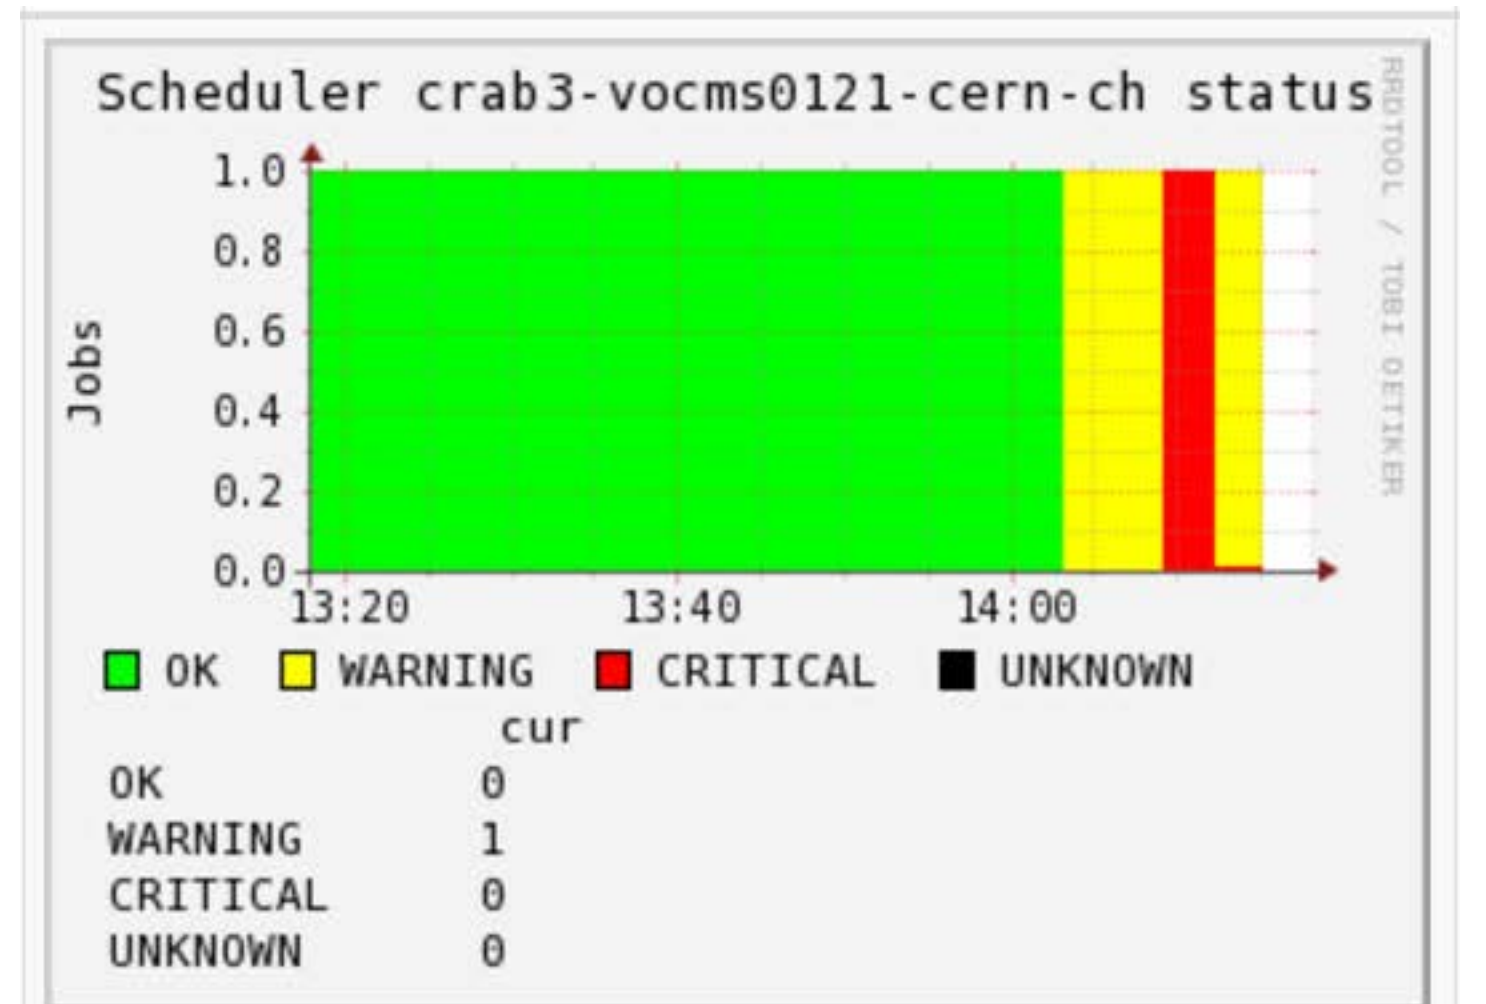

- *HTCondor* + *HTCondor python bindings* for retrieving all Classads from Schedulers, Collectors, Factories;
- *Python-genshi* – Generate HTML templates;
- *htp* + *mod\_wsgi* – Apache HTTP Server;
- *RRDtool* – data logging for time series data.
