#207 - A new mechanism to persistify the detector geometry of ATLAS and serving it through an experiment-agnostic REST API

Riccardo Maria BIANCHI (*Pittsburgh*), Joe BOUDREAU (*Pittsburgh*), Ilija VUKOTIC (*Chicago*)

Contact: boudreau@pitt.edu

- The GeoModel package provides geometry primitives and basic shapes to describe the detector geometry of a HEP experiment

- Until now GeoModel was part of the ATLAS software and it was accessible only from the experiment's framework

- We now ported GeoModel outside of the experiment framework to be used as a cross-platform and experiment-agnostic geometry package

- Also, we designed and implemented a persistification mechanism to store the detector description into a file and to restore and to serve it from that
