- GEMPix detector for hadrontherapy
- GEMPix layout
- CNAO measurements: experimental setup and first results
- GEANT4 simulation
- Conclusions and future developments

A possible detector for hadrontherapy (I)

Fundamental Requirements

- **High rate capability and Radiation hardness** → High fluxes (10^8 particles/s) of carbon ions, protons, oxygen...
- **Good spatial resolution** → Beam diagnostic for daily quality controls and dosimetric measurements of treatment plans.

Good candidate → **GEM**Pix detector – a Timepix based **GEM** detector

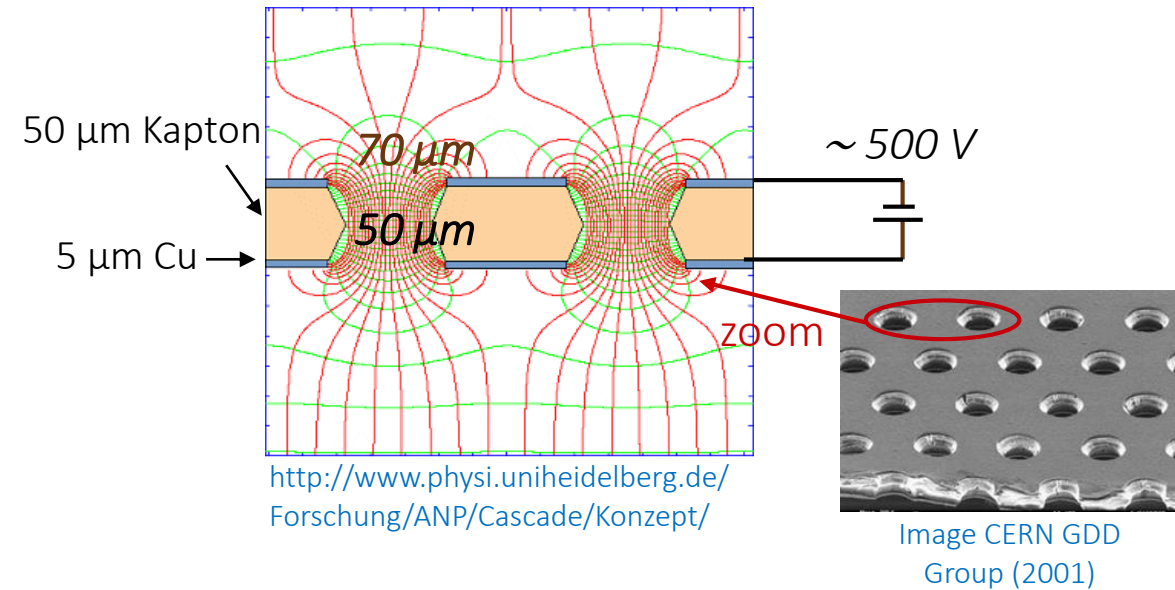

Already used for: Radioactive waste/ Microdosimetry/ Radiotherapy / Radon monitoring @ CERN
(<http://ardent.web.cern.ch/ardent/ardent.php?link=publications>)

A possible detector for hadrontherapy (II)

What is a GEM detector?

GEM foil → Kapton sheet (50 μm thick) metallized at both sides (5 μm of Cu) with 70 μm holes etched inside

Electrical field ~ 100 kV/cm inside the holes
→ **localised** electron avalanche

How does the GEMPix work ?

Primary particle interaction in the Drift gap

Electrons multiplication: up to 40 output electrons for each electron in. Three GEM foils give gains up to $10^5 \rightarrow f(\text{gas})$

Readout: electrons are collected by the Timepix chip

GEMPix: detector and readout system

2. HV Connector / 5. Timepix Readout

Layout

Developed by ARDENT project (CERN – INFN).

Read by 4 *naked Timepix chips*

Active area $\rightarrow 9 \text{ cm}^2$

Readout System

- Each pixel can measure the deposited charge and count the single particle.
- Detection threshold around 1000 electrons (noise ~ 100 electrons)
- Readout configuration with 4 chip (512x512) $\rightarrow 2.6 \times 10^5$ pixels

TOA \rightarrow Time Of Arrival (**3D single track reconstruction**)

TOT \rightarrow Time Over Threshold (**Charge and dE/dX**)

\rightarrow TOA and TOT clock up to 100 MHz, but stable at 50 MHz

GEMPix: *experimental setup at CNAO*

Particles type: **carbon ions** (single beam spot and scanned field)

Beam Energy: **3.9 GeV and 3.4 GeV**

Particles per *spill*: **8×10^5**

Measurements: ***Linearity, homogeneity and energy measurements at different water depths***

Motorized 3D water phantom

GEANT4 simulation: *experimental setup*

The CNAO extraction beamline and the experimental setup are fully simulated

PMMA box for
GEMPix

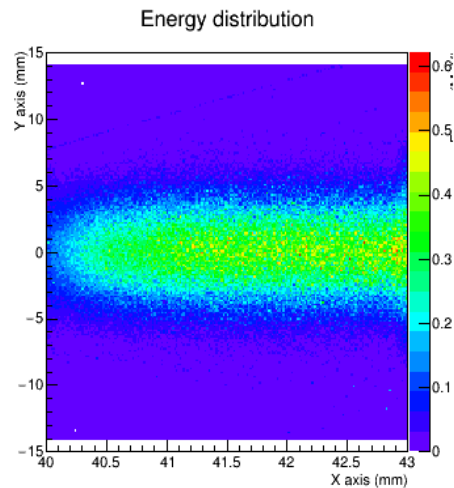

All the layers of the GEMPix active area are simulated with the corresponding materials

Geant4 simulation parameters

- ✓ **Release version: Geant4 10.0 patch 03**
- ✓ **Physics Lists (for Carbon Ions):** G4EMStandardPhysics_option4, G4RadioactiveDecayPhysics, G4IonBinaryCascadePhysics, G4EmExtraPhysics, G4HadronElasticPhysicsHP, G4StoppingPhysics, G4EmPenelopePhysics, G4NeutronTrackingCut, G4HadronPhysicsQGSP_BIC_HP
- ✓ Parallel geometries for scoring purposes (3D mesh) and sensitive detectors
- ✓ Single spot and scanned beam irradiation methods implemented

GEANT4 Simulation: *Lateral Profiles*

Carbon ion beams:
2D transversal and
longitudinal view

Beam vertical (y) and lateral (z) profile.

Energy distribution vs X coordinate

Black dots: EBT3 film
Blue line: Geant4 simulation

Lateral profile of the energy deposited by **3.9 GeV carbon ions** beam spot along the beam axis (x) within the 3 mm *drift gap*

Cross-check with CNAO data from EBT3 radiochromic films

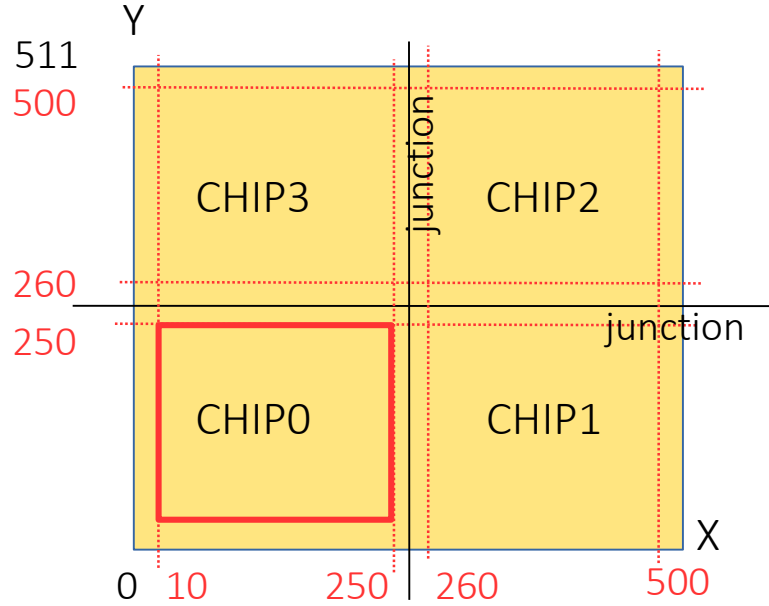

CNAO measurements: *linearity*

- Irradiation method: 60x60 mm² scanned field - 3.4 GeV carbon ions
- 5 fluxes: 3×10^4 - 5×10^4 - 8×10^4 - 10^5 - 2×10^5 total particles delivered

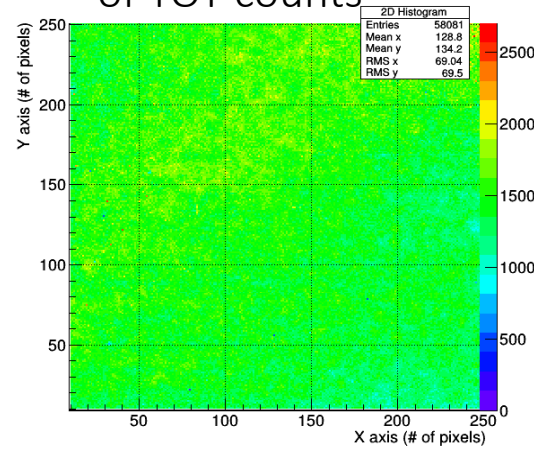

Active scanning

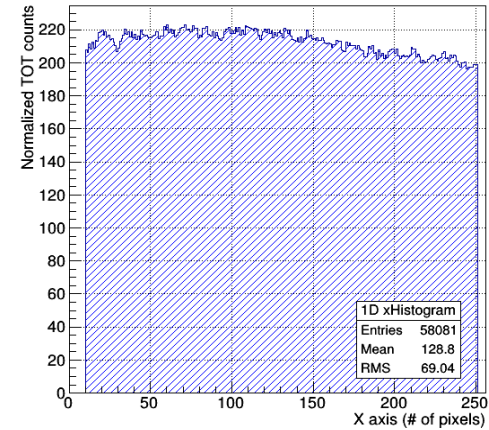

The scanned field dimensions allow to neglect side effects by including all the detector's sensitive area

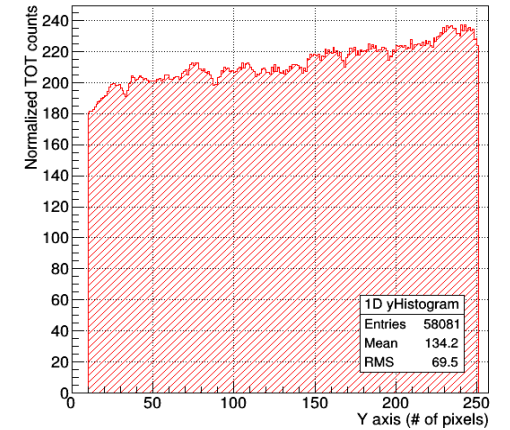

2D histogram of TOT counts

X projection (from pixel 0 to pixel 250)

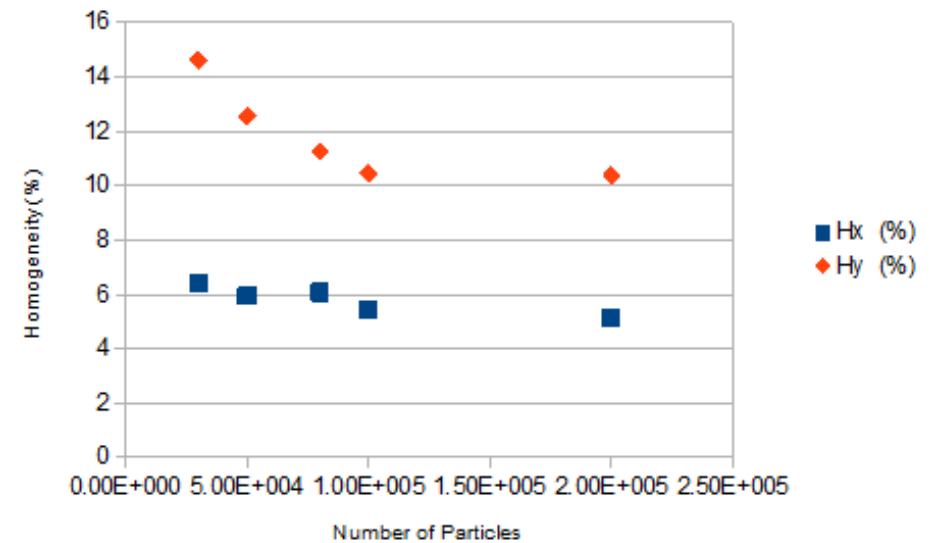

Y projection (from pixel 0 to pixel 250)

SINGLE CHIP homogeneity:

$$H(\%) = (\text{Max Count} - \text{Min Count}) * 100 / (\text{Max Count} + \text{Min Count})$$

Homogeneity CHIP0

2D histograms of TOT counts obtained with 3.9 GeV carbon ions beam spot as a function of the GEMPix position in water

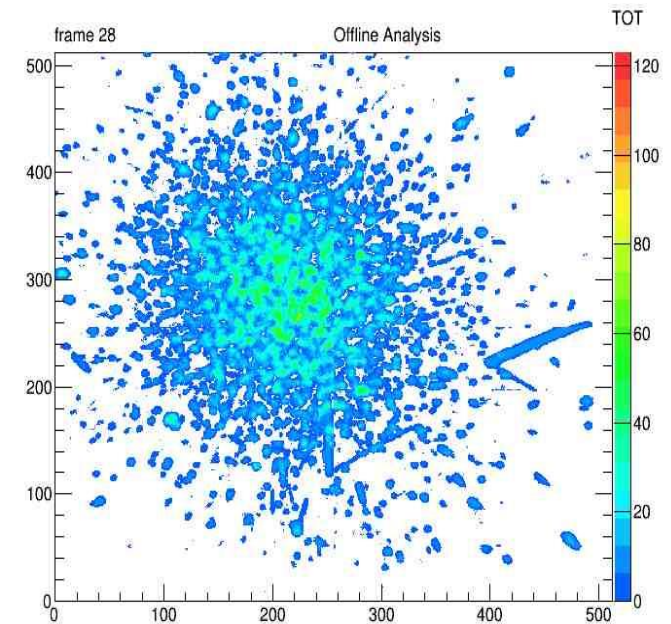

Plateau

Peak

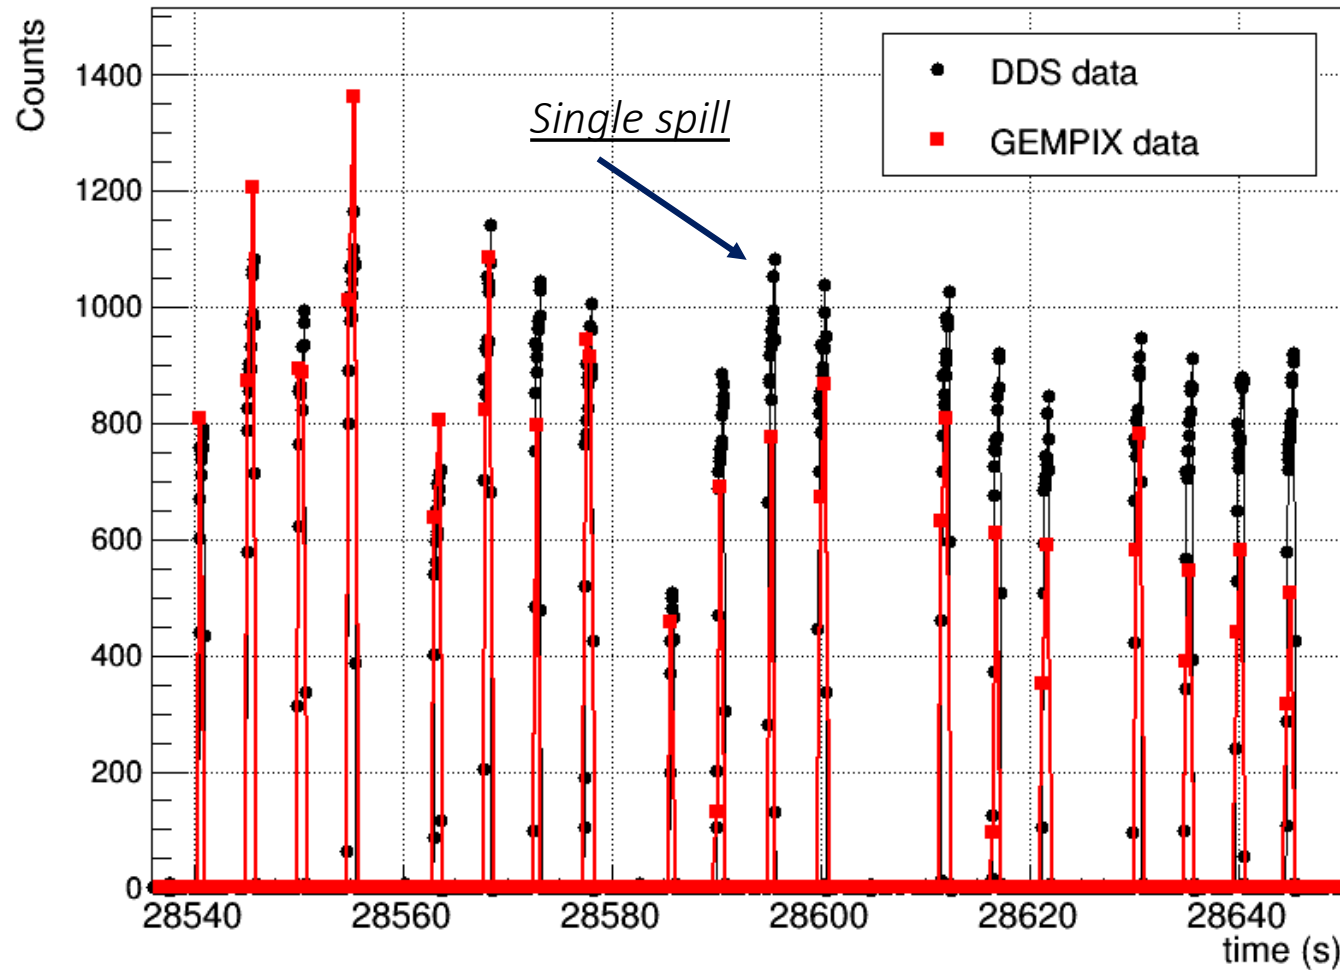

Tail

Further studies are currently ongoing to determine the origin of lateral clusters.

Beam time/space evolution

3.4 GeV carbon ions beam spot

DDS (Dose Delivery System)

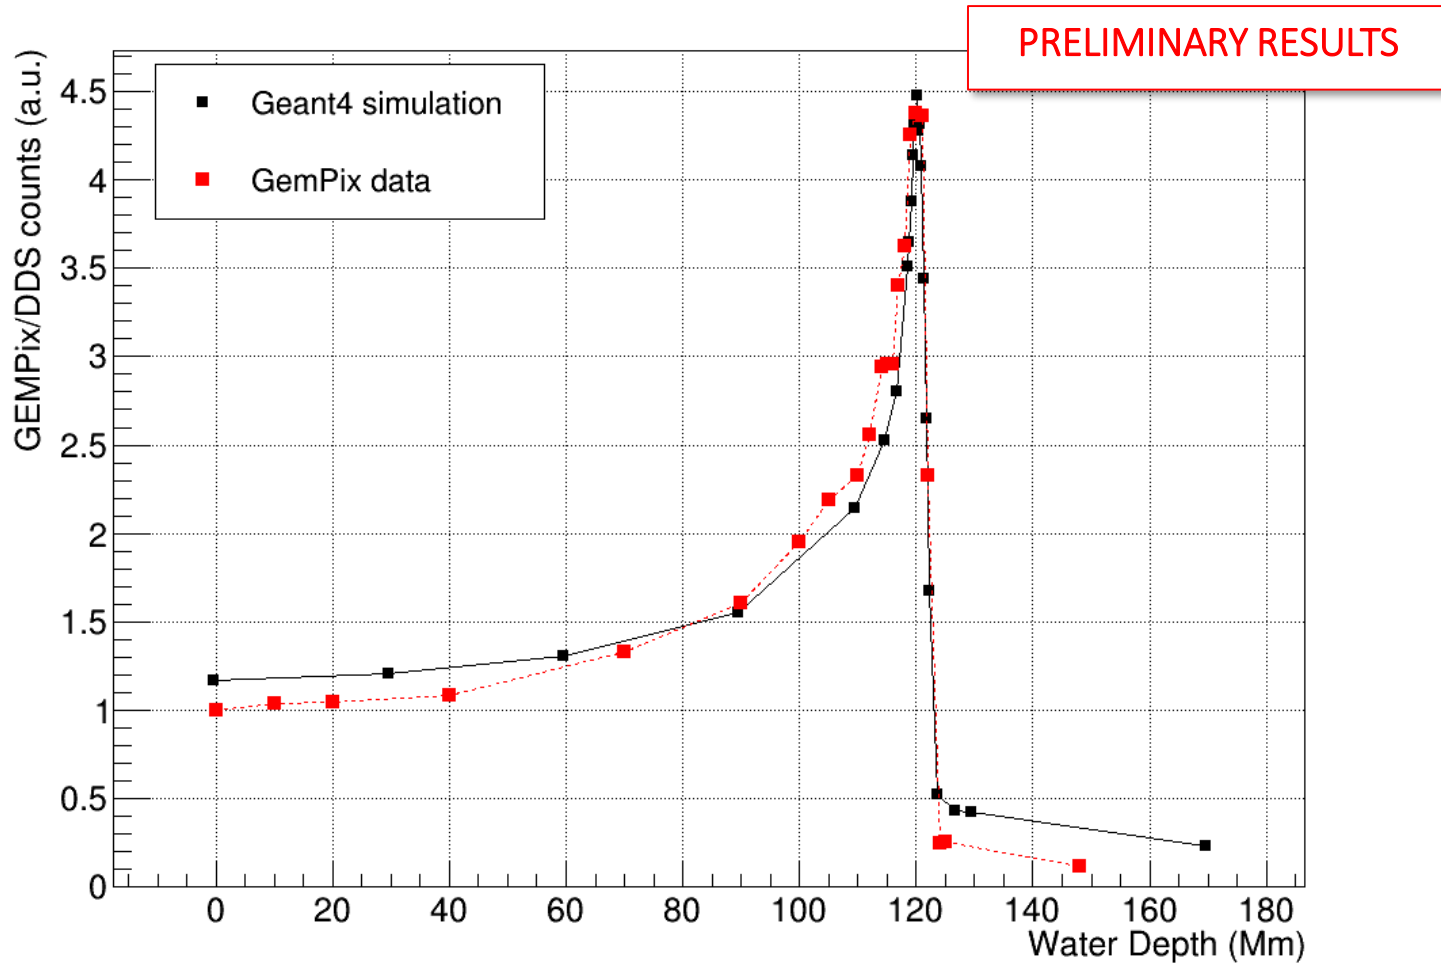

CNAO beam control system

(Ionization and pixels chambers)

Med Phys. 2015 Jan;42(1):263-75. doi: 10.1118/1.4903276.

CNAO measurements: *Bragg Peak* (II)

3.4 GeV carbon ions beam spot

Deposited dose underestimated:

- Plateau region
- Fragmentation tail

→ Ongoing studies on physics lists and interaction processes in Geant4.

→ Further characterization tests of the GEMPix detector with carbon ion beams (different clock, gain, gas ...)

The curves are normalized at the peak

3D reconstruction 3.9 GeV carbon ions Bragg peak in water

Conclusions

Complete simulation of the CNAO extraction beamline, GEMPix detector and experimental setup

Linear response as a function of particle flux

Quite good homogeneity response → study of edge/junction effects

Good agreement between data and simulation

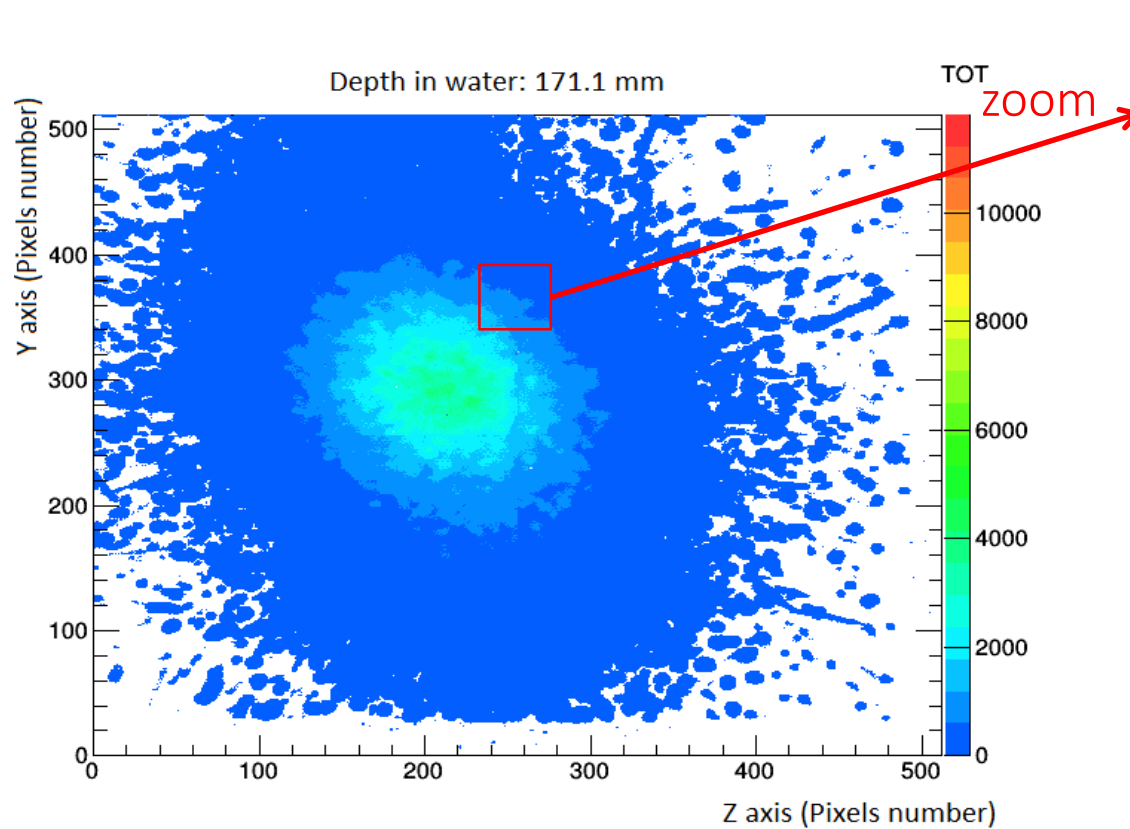

Further experimental measurements have been done at CNAO and are being analysed

Future developments

- More detailed simulation → electric field of GEM layers
- Advanced simulation study of secondary particle distribution in water and in the GEMPix
- Study of the Bragg curve for different GEMPix setting parameters (gain, acquisition clock)
- Continuous monitoring of pressure and temperature inside the detector during the measurements
- Implementation of a better trigger system between GEMPix and DDS CNAO system
- New measurements at CNAO Centre

GEMPix and SEU (Single Event Upset)

SEU events above (red) and below (orange) the TOT saturation level (11000)

SEU is a function of water depth

Maximum value of SEU at the Bragg peak → maximum dose release

Energy calibration and T/P correction

The temperature and the pressure measured **inside the detector** allow **the realtime HV correction** to obtain gain stability

Online
HV correctic

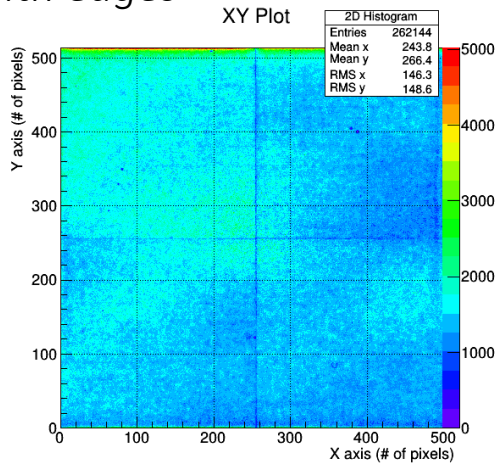

CNAO measurements: *homogeneity (I)*

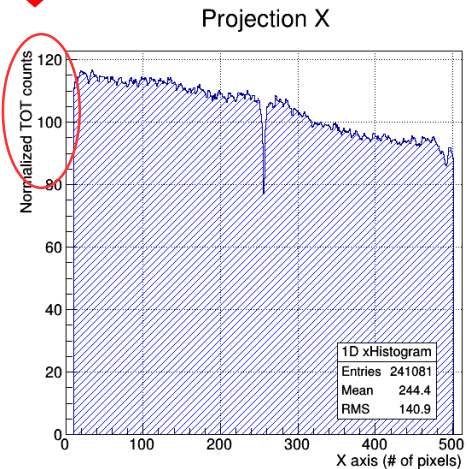

PRELIMINARY RESULTS

60 mm² carbon ions scanned field (3×10^4 total particles delivered)

With edges

Without edges

Edge effects → 2% of saturated pixels at higher particle fluxes
