## CORE+ Telescope

Karl Young, Shaul Hanany, Neil
Trappe, Darragh McCarthy

## Comments on

- Where we are
- Baffles + Stop
- Focal Surface Shape
- ARC

## Telescope configuration trade-off

Four configurations considered:

- Gregorian option 1

Selected option:
Fits in V-Grooves and can easily be mounted

- Gregorian option 2

Does not fit in V-Grooves

- Open Dragone $\qquad$
- Cross-Dragone with F~2

Complex Thermo-Mechanical accommodation

Large secondary mirror

## Telescope baseline

## Cesa

Gregorian configuration:

$$
\text { Aperture }=1.2 \mathrm{~m}-\mathrm{F} / \mathrm{D} \sim 2
$$

- Primary Mirror 1.5X1.2 m
- Secondary reflector diameter $=1 \mathrm{~m}$
- Monolithic SiC technology unlike Planck

## Focal plane layout

Figure 3: Sketch of the focal plane of COrE+ Light. Contours are Strehl $=0.8$ for 60, 90, 130, $160,220,340,450$, and 600 GHz .

## 1.5 m Aperture Gregorian, Optimized Dragone, with Aspherics

- Baffles are necessary
- Note compactness of system
- Need GRASP including baffles

The primary mirror is the aperture stop

Fields at:
$-5.5 \mathrm{deg}$
$-3.5 \mathrm{deg}$
$-2.0 \mathrm{deg}$
0 deg
2.0 deg
3.5 deg
5.5 deg

## Cold Stop Enforced (for most of the rays)

Vignetting: Some rays are limited by the stop, some by the primary.

50.00 CM

## Change in pupil footprint area due to vignetting

| Field Angle (degrees) | Area relative to <br> unvignetted 1.5m pupil |
| :--- | :--- |
| 0 | 1.00 |
| $+3(-3)$ elevation | $1.03 ;(0.89)$ |
| $5.5(-5.5)$ elevation | $1.01 ;(0.79)$ |
|  |  |
| +3.5 in azimuth | 0.98 |
| +5.5 in azimuth | 0.88 |

## Change in Strehl with Cold Stop; 60 GHz

| El. Field angle <br> (degrees) | No stop | Stop 90 cm from focal <br> plane |
| :--- | :--- | :--- |
| 0 | 0.99 | 0.99 |
| 5.5 | 0.81 | 0.84 |
| -5.5 | 0.84 | 0.85 |
| Az. Field angle <br> (degrees) |  |  |
| 5.5 | 0.79 | 0.825 |

Strehl is the ratio of peak energy to peak energy of diffraction limited system system. It is a single point measure. It gives no information about beam shape.

## PSFs

Color scale dB at focal plane, normalized to 0 .

PSFs

$60 \mathrm{GHz}, 5.5 \mathrm{deg}$ azimuth

PSFs

150 GHz, Center

150 GHz, 3 deg elevation

Color scale dB at focal plane, normalized to 0.

## Didn't yet check

- Polarization - should use GRASP
- Higher Frequencies

## Conic, Non-telecentric, Focal Surface: <br> What if we tilt the arrays?

Chief rays for 7 field angles.

## Results

| $\begin{gathered} \text { Field } \\ \text { (degrees) } \end{gathered}$ | Freq.(GHz) | $\begin{aligned} & \mathrm{AOI} \\ & \text { (deg) } \end{aligned}$ | Defocus (cm) |  | Strehl at focus | Strehl |  |  |  | $\begin{gathered} \text { average } \\ \text { delta } \\ \text { strehl/cm } \end{gathered}$ |

Need to steer the beams

## Or - Use a Lens?

Alumina lens $\sim 60 \mathrm{~cm}$ diameter

$\mathrm{n}=3.1$
Flat focal plane
Fields shown = +-5 deg Telecentric within 10 deg
F\#= $\sim 1.8$
Strehl ratios similar to F\#=2 (requires more detailed study)
~60 cm diameter
46.30 CM

## Broadband ARC - Laser Ablation

## Summary

- So far: 1.5 m ; Should we look at 1.2 m ?
- Low T baffles/stop
- Baffles: OK
- Stop: questionable
- Do more detailed GRASP for polarization and far sidelobes
- Focal Plane:
- Steer the beam
- Use lens?

## Backup Slides

## To Do

## F-number across focal plane

For comparison EBEX2013 had f/\#
from 1.86-2.04

## PSFs, at $150 \mathrm{GHz}, 3$ degrees elevation

Strehl $=0.81$

Strehl $=0.83$

## PSFs, at 150 GHz , -4 degrees elevation

Strehl $=0.80$

Strehl $=0.81$

## PSFs, at 150 GHz, 3 degrees azimuth

Strehl $=0.92$
Strehl $=0.91$

## PSFs, at $60 \mathrm{GHz}, 5.5$ degrees elevation Polarized input, primary is stop.

Strehl $=0.813$

Horizontal polarization

Strehl $=0.812$

## PSFs at $150 \mathrm{GHz}, 0$ degrees

Strehl = . 99 for both

Color scale dB at focal plane, normalized to 0 .
