where

$$\overline{|\mathcal{M}|^2} = \underbrace{\left(\frac{1}{3} \cdot \frac{1}{3}\right)\left(\frac{1}{2} \cdot \frac{1}{2}\right)}_{\text{average color and spin}} \sum_{\substack{spin \\ color}} \left| \text{} \right|^2$$

$$Tr\left[\not{p_1}\gamma_\mu P_L \ \not{p_2}\gamma^\mu P_L\right](-1)$$

$$= Tr\left[\not{p_1}\gamma_\mu \ \not{p_2}\gamma^\mu P_L\right](-1) \qquad\qquad P_L P_L = P_L = \frac{1}{2}\left(1 - \gamma_5\right)$$

$$= (-2)\,Tr\left[\not{p_1}\ \not{p_2}P_L\right](-1) \qquad\qquad \gamma_\mu \ \not{p_2}\gamma^\mu = -2\ \not{p_2}$$

$$= (-2)\cdot\frac{1}{2}\cdot 4\left(p_1\cdot p_2\right)(-1) \qquad\qquad Tr\left(\not{p_1}\ \not{p_2}\right) = 4\left(p_1\cdot p_2\right)$$

$$= +2\hat{s} \qquad\qquad\qquad\qquad\qquad\qquad Tr\left(\not{p_1}\ \not{p_2}\gamma_5\right) = 0$$

$$Tr\left[I_{3\times3}\right] = 3 \qquad\qquad \left(\hat{s} \equiv (p_1+p_2)^2 = q^2 \text{ and } p_1^2 = p_2^2 = 0\right)$$

$$\Rightarrow \quad \quad = \left(\frac{g_w}{\sqrt{2}}\right)^2 \cdot (+2\hat{s})\,(3) = 3\,g_w^2\,\hat{s}$$

$$\int \frac{d^3q}{2q_0}\delta^4\left(p_1+p_2-q\right) = \int d^4q\,\delta^4\left(p_1+p_2-q\right)\delta^+\left(q^2-M^2\right)$$

$$= \delta\left(q^2 - M^2\right)$$

where M is the mass of W-boson.

Thus,

$$\hat{\sigma}_{q\bar{q}'} = \frac{1}{2\hat{s}}\,(2\pi)\cdot\delta\left(\hat{s}-M^2\right)\cdot\left(\frac{1}{3}\right)\left(\frac{1}{2}\cdot\frac{1}{2}\right)\cdot g_w^2\hat{s}$$

$$= \frac{\pi}{12}g_w^2\delta\left(\hat{s}-M^2\right)$$

$$= \frac{\pi}{12\hat{s}}g_w^2\delta\left(1-\hat{\tau}\right)$$

$$\left(\begin{array}{c} \hat{\tau} = M^2/\hat{s}\,,\ \hat{s} = x_1 x_2 S \ \text{ for} \\ S = (P_1+P_2)^2 \ \text{and } P_1^2 = P_2^2 = 0 \end{array}\right)$$

Nonperturbative, but universal, hence, measurable

IRS, Calculable in pQCD

Procedure:

(1) Compute σ_{kl} in pQCD with k, l partons (not h, h' hadron)

$$\sigma_{kl} = \sum_{i,j} \int_0^1 dx_1 dx_2\, \phi_{i/k}\left(x_1, Q^2\right) H_{ij}\left(\frac{Q^2}{x_1 x_2 S}\right) \phi_{j/l}\left(x_2, Q^2\right)$$

(2) Compute $\phi_{i/k}, \phi_{j/l}$ in pQCD

(3) Extract H_{ij} in pQCD

H_{ij} IRS $\Rightarrow H_{ij}$ indepent of k, l

$\Rightarrow$ same H_{ij} with $(k \rightarrow h, l \rightarrow h')$

(4) Use H_{ij} in the above equation with $\phi_{i/h}, \phi_{j/h'}$

Extracting H_{ij} in pQCD

- **Expansions in α_s:**

$$\sigma_{kl} = \sum_{n=0}^{\infty} \left(\frac{\alpha_s}{\pi}\right)^n \sigma_{kl}^{(n)} \qquad\qquad \alpha_s = \frac{g^2}{4\pi}$$

$$H_{ij} = \sum_{n=0}^{\infty} \left(\frac{\alpha_s}{\pi}\right)^n H_{ij}^{(n)}$$

$$\phi_{i/k}(x) = \delta_{ik}\delta(1-x) + \sum_{n=1}^{\infty} \left(\frac{\alpha_s}{\pi}\right)^n \phi_{i/k}^{(n)}$$

$$\uparrow$$

$$\phi_{i/k}^{(0)} \ (\alpha_s = 0 \Rightarrow \text{Parton k `` stays itself ''})$$

- **Consequences:**

$$H_{ij}^{(0)} = \sigma_{ij}^{(0)} = \text{``Born''} \qquad \boxed{\text{suppress "\^" from now on}}$$
$$H_{ij}^{(1)} = \sigma_{ij}^{(1)} - \left[\ \sigma_{il}^{(0)}\phi_{l/j}^{(1)} + \phi_{k/i}^{(1)}\sigma_{kj}^{(0)}\ \right]$$

Immediate problems (Singularities)

- **Ultraviolet singularity**
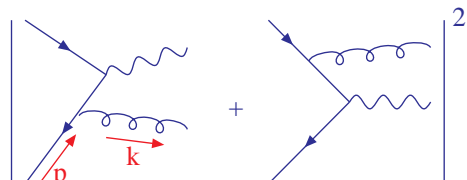

(UV)

$$\sim \quad \int^{\infty} d^4k \frac{\not{k}\,\not{k}}{(k^2)\,(k^2)\,(k^2)} \quad \to \quad \infty$$

- **Infrared singularities**

(IR)

$$\to \quad \infty$$

as $k^\mu \to 0$ (soft divergence)

or $k^\mu \parallel p^\mu$ (collinear divergence)

$$\frac{1}{(p-k)^2 - m^2} = \frac{1}{-2p\cdot k} \quad \text{(for } m=0 \text{ or } m \neq 0\text{)}$$

$p \cdot k \to 0$ as

$k \to 0$ or $k^\mu \parallel p^\mu$ (for $m = 0$)

$k \to 0$ (for $m \neq 0$)

(Similar singularities also exist in virtual diagrams.)

- **Solutions**

Compute H_{ij} in pQCD in $n = 4 - 2\varepsilon$ dimensions
(dimensional regularization)
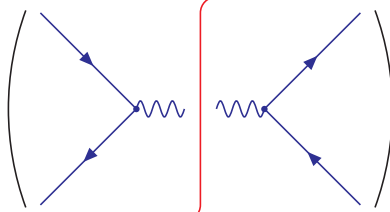

(1) $n \neq 4 \Rightarrow$ UV & IR divergences appear as $\frac{1}{\varepsilon}$ poles
in $\sigma_{ij}^{(1)}$ (Feynman diagram calculation)

(2) H_{ij} is IR safe $\Rightarrow$ no $\frac{1}{\varepsilon}$ in H_{ij}
(H_{ij} is UV safe after "renormalization".)

1

-

$$\hat{\sigma}_{q\bar{q}'}^{(0)} = \frac{1}{2\hat{s}} \int \frac{d^{n-1}q}{(2\pi)^{n-1} \, 2q_0} \, (2\pi)^n \cdot \delta^n \, (p_1 + p_2 - q) \cdot \overline{|m|^2}$$

-

$$\overline{|m|^2} = \left(\frac{1}{3} \cdot \frac{1}{3}\right) \left(\frac{1}{2} \cdot \frac{1}{2}\right) \cdot \left(\text{(Feynman diagram)} \right)$$

In n-dim, the polarization degree of freedom is (2) for a quark, and (n-2) for a gluon.

- Using the Naive-γ^5 prescription:

$$Tr\left[\not{p}_1 \gamma_\mu P_L \; \not{p}_2 \gamma^\mu P_L\right](-1)$$

$$= Tr\left[\not{p}_1 \gamma_\mu \; \not{p}_2 \gamma^\mu P_L\right](-1) \qquad \gamma_\mu \; \not{p}_2 \gamma^\mu = -2\,(1-\varepsilon) \; \not{p}_2$$

$$= (-2)\,(1-\varepsilon)\,Tr\left[\not{p}_1 \; \not{p}_2 P_L\right](-1)$$

$$= (-2)\,(1-\varepsilon) \cdot \frac{1}{2} \cdot 4\,(p_1 \cdot p_2)\,(-1)$$

$$= 2\,(1-\varepsilon)\,\hat{s}$$

- In n dimensions

$$\hat{\sigma}_{q\bar{q}'}^{(0)} = \frac{\pi}{12\hat{s}} g_w^2 \cdot (1-\varepsilon) \cdot \delta\,(1-\hat{\tau}) \equiv \sigma^{(0)} \cdot \delta\,(1-\hat{\tau})$$

Strong Coupling g in n dimensions

- In n dimensions

$$\int d^n x \mathcal{L}$$

$$\longrightarrow \int d^n x \left\{ \bar{\psi} i \not{\partial} \psi - \frac{1}{4} G_{\mu\nu} G^{\mu\nu} + g t^a \bar{\psi} \gamma^\mu G_\mu \psi + \cdots \right\}$$

The dimension in mass unit (μ)

$$[\psi] \sim \mu^{\frac{n-1}{2}}$$

$$[G] \sim \mu^{\frac{n-2}{2}}$$

$$\left[\bar{\psi} G \psi \right] \sim \mu^{\frac{n-1}{2} \times 2 + \frac{n-2}{2}} = \mu^{\frac{3n}{2} - 2}$$

Since $\left[g \bar{\psi} G \psi \right] \sim \mu^n$, so

$$[g] \sim \mu^{\frac{-n}{2} + 2} \qquad\qquad n = 4 - 2\varepsilon$$

$$= \mu^\varepsilon$$

$\Rightarrow$ g has a dimension in mass when $\varepsilon \neq 0$

$\Rightarrow$ Feynman rules should read $g \to g \mu^\varepsilon$

Summary

- $\phi_{f/h}(x,\mu^2)$ depends on scheme ($\overline{MS}$,DIS,...)
  $\Rightarrow H_{ij}$ **scheme dependent**

- Evolution equations allow us to perdict
  q^2-**dependent of** $\phi(x,q^2)$

- Essentially identical procedure for
  $hh' \rightarrow jets$, inclusive $Q\overline{Q}$,...
  But, when the Born level process involves
  strong interaction (eg. $q\overline{q} \rightarrow t\overline{t}$),
  it is also necessary to renormalize the
  strong coupling α_s, etc, to eliminate
  ultraviolate singularities

γ-matrices in n dimensions

- **Dirac algebra**

$$\{\gamma^\mu, \gamma^\nu\}_+ \equiv \gamma^\mu \gamma^\nu + \gamma^\nu \gamma^\mu = 2g^{\mu\nu}$$
$$\mu, \nu = 1, 2, \cdots, n \qquad g^{\mu\nu} = diag\,(1, -1, \cdots, -1)$$
$$g^{\mu\nu} g_{\mu\nu} = n$$
$$\{\gamma^\mu, \gamma^5\}_+ = 0 \qquad \left(\text{Naive-}\gamma^5 \text{prescription}\right)$$

This works in calculating the inclusive rate of W-boson ,
but fails in the differential distributions of the leptons
from the W-boson decay.

- **Matrix identities**

$$n = 4 - 2\varepsilon$$

$$\gamma_\mu\ \slashed{a}\gamma^\mu = -2\,(1 - \varepsilon)\ \slashed{a}$$
$$\gamma_\mu\ \slashed{a}\ \slashed{b}\gamma^\mu = 4a \cdot b - 2\varepsilon\,\slashed{a}\,\slashed{b}$$
$$\gamma_\mu\ \slashed{a}\ \slashed{b}\ \slashed{c}\gamma^\mu = -2\ \slashed{c}\ \slashed{b}\ \slashed{a} + 2\varepsilon\ \slashed{a}\ \slashed{b}\ \slashed{c}$$

- **Traces**

$$Tr\,[\slashed{a}\ \slashed{b}] = 4\,(a \cdot b)$$
$$Tr\,[\slashed{a}\ \slashed{b}\ \slashed{c}\ \slashed{d}] = 4\,\{(a \cdot b)\,(c \cdot d) - (a \cdot c)\,(b \cdot d) + (a \cdot d)\,(b \cdot c)\}$$
$$Tr\,[\gamma_5\ \slashed{a}\ \slashed{b}] = 0$$

Some integrals and "special functions"

- The "Gamma function"

$$\Gamma(z) = \int_0^\infty dx\, x^{z-1} e^{-x} \qquad (\mathrm{Re}(z) > 0)$$

$$\Gamma(z-1) = \frac{\Gamma(z)}{z-1} \qquad \text{(for all z)}$$

$$\Rightarrow \text{Poles in } \Gamma(z)$$

$$\Gamma(n) = (n-1)! \qquad \Gamma\left(\frac{1}{2}\right) = \sqrt{\pi}$$

$$\Gamma(\varepsilon) = \frac{1}{\varepsilon} - \gamma_E + \frac{\varepsilon}{2}\left(\gamma_E^2 + \frac{\pi^2}{6}\right) + \cdots$$

$$(\gamma_E = 0.5772\cdots, \ \text{Euler constant})$$

$$\Gamma(1-\varepsilon) = -\varepsilon\Gamma(\varepsilon) = 1 + \varepsilon\gamma_E + \frac{1}{2}\varepsilon^2\left(\frac{\pi^2}{6} + \gamma_E^2\right) + O\left(\varepsilon^3\right)$$

$$\Gamma(1-\varepsilon)\Gamma(1+\varepsilon) = 1 + \varepsilon^2\frac{\pi^2}{6} + O\left(\varepsilon^4\right)$$

$$z^\varepsilon = e^{\ln z^\varepsilon} = e^{\varepsilon \ln z} = 1 + \varepsilon \ln z + \cdots$$

- The "Beta function"

$$B(\alpha,\beta) = \frac{\Gamma(\alpha)\Gamma(\beta)}{\Gamma(\alpha+\beta)}$$

$$B(\alpha,\beta) = \int_0^1 dy\, y^{\alpha-1}(1-y)^{\beta-1} = \int_0^\infty dy\, y^{\alpha-1}(1+y)^{-\alpha-\beta}$$

$$= 2\int_0^{\frac{\pi}{2}} d\theta\, (\sin\theta)^{2\alpha-1}(\cos\theta)^{2\beta-1}$$

- Feynman trick

$$\frac{1}{ab} = \int_0^1 dx \frac{1}{[ax + b(1-x)]^2}$$

$$\frac{1}{a^\alpha b^\beta} = \frac{\Gamma(\alpha + \beta)}{\Gamma(\alpha)\Gamma(\beta)} \int_0^1 dx \frac{x^{\alpha-1}(1-x)^{\beta-1}}{[ax + b(1-x)]^{\alpha+\beta}}$$

- n-dimension integrals

$$\int d^n l \frac{l_\mu}{(l^2 - M^2)^\alpha} = 0$$

$$\int d^n l \frac{l_\mu l_\nu}{(l^2 - M^2)^\alpha} = \int d^n l \frac{\left(\frac{l^2 g_{\mu\nu}}{n}\right)}{(l^2 - M^2)^\alpha}$$

$$\int \frac{d^n l}{(2\pi)^n} \frac{1}{(l^2 - M^2)^\alpha} = i \frac{(-1)^\alpha}{(4\pi)^{n/2}} \frac{\Gamma\left(\alpha - \frac{n}{2}\right)}{\Gamma(\alpha)} \left(\frac{1}{M^2}\right)^{\alpha - \frac{n}{2}}$$

$$\int d^n l \frac{l^2}{(l^2 - M^2)^\alpha} = \int d^n l \frac{(l^2 - M^2) + M^2}{(l^2 - M^2)^\alpha}$$

-

$$\mathrm{Re}\,[(-1)^\varepsilon] = 1 - \varepsilon^2 \frac{\pi^2}{2} + O\left(\varepsilon^4\right)$$

$$\left(-1 = e^{i\pi}\right)$$

- "plus distribution" — to isolate $\frac{1}{\varepsilon}$ poles

Consider $\dfrac{1}{(1-z)^{1+2\varepsilon}}$

$$= \frac{1}{(1-z)^{1+2\varepsilon}} - \left[\delta(1-z) \int_0^1 \frac{dz'}{(1-z')^{1+2\varepsilon}} + \frac{1}{2\varepsilon}\delta(1-z) \right]$$

cancel

because $\displaystyle\int_0^1 \frac{dz'}{(1-z')^{1+2\varepsilon}} = \frac{-1}{2\varepsilon}$ for $\varepsilon \to 0^-$

$$\equiv \left[\frac{1}{(1-z)^{1+2\varepsilon}} \right]_+ - \frac{1}{2\varepsilon}\delta(1-z)$$

$$= \frac{1}{(1-z)_+} - 2\varepsilon \left[\frac{\ln(1-z)}{1-z} \right]_+ + O\left(\varepsilon^2\right) - \frac{1}{2\varepsilon}\delta(1-z)$$

because $\dfrac{1}{(1-z)^{2\varepsilon}} = (1-z)^{-2\varepsilon}$

$$= 1 - 2\varepsilon \ln(1-z) + \cdots$$

- $[\cdots]_+$ is a distribution

$$\int_0^1 dz\, f(z) \left[\frac{1}{1-z} \right]_+$$

$$\equiv \int_0^1 dz\, \frac{f(z)}{1-z} - \int_0^1 dz\, f(z)\, \delta(1-z) \int_0^1 \frac{dz'}{(1-z')}$$

$$= \int_0^1 dz \frac{f(z) - f(1)}{1-z}, \text{ which is finite.}$$

  with $k^\mu = \left(k_0, \vec{k}\right)$, etc.

  Use $\dfrac{d^{n-1}\vec{q}}{2q_0} = \displaystyle\int d^n q\, \delta^+\left(q^2 - Q^2\right)$, we get

  $$\left(p^2 \equiv \hat{s}, k^2 = 0, k = \left|\vec{k}\right|\right)$$

  Use $n = 4 - 2\varepsilon$, then in the c.m. frame $\left(p^\mu = \left(\sqrt{\hat{s}}, \vec{0}\right)\right)$,

  Use new variables:

  $$z = \frac{Q^2}{\hat{s}}, y = \frac{1}{2}(1 + \cos\theta) \Rightarrow k = \frac{\sqrt{\hat{s}}}{2}(1 - z),$$

- $$\int_{PS_2(p)} dk\, dq = \frac{1}{8\pi} \left(\frac{4\pi}{Q^2}\right)^\varepsilon \frac{z^\varepsilon (1 - z)^{1-2\varepsilon}}{\Gamma(1 - \varepsilon)} \int_0^1 dy\, [y\,(1 - y)]^{-\varepsilon}$$

$$\hat{t} = (p_1 - p_3)^2 = -2p_1 \cdot p_3$$
$$\hat{u} = (p_2 - p_3)^2 = -2p_2 \cdot p_3$$
