

Git hackathon

Meg Ryan (GPL)

- Feedback on instructions
 - Instructions a bit too literal (we are not all **graeme**)
- Questions / discussion points
 - How do we build using CMake? Just build everything that is checked out (okay, but we need to keep offline repo clean!)
 - CMake of aogt2 packages took <5m to run. make failed, but doesn't look serious.
 - Forks should be mirrored automatically
 - 2 levels of fork/mirror look fragile - recommend we stick to one fork of core repo.
 - Advanced workflows -
 - Multiple sparsecheckouts ... how do we support these?
 - Multiple developments testing together - encapsulation branches?
- Tools
 - Lots of interest in cms-addpackage equivalent
 - some automated way to notify branch managers about interesting bugfixes

- Timescale?!
