

Job Config Talkathon

- Some discussion about the declarative layer
 - The pickled configuration just before the C++ code starts
 - Want to get a better ‘viewer’ that visualizes the result of RecExCommon
- Agreed to push phase-out of ‘include’
 - That was a sin and now we are in purgatory
 - We realize that the current implementation of athena.py heavily uses include
 - At least try weed it out at client-configuration (eg RecExCommon should be the last thing that is actually included this way)
- Consensus that confGetter/configuredFactory is a big step forward
 - Should be used more widely
- Tendency towards a adiabatic migration instead of a disruptive one
 - athenaMT public-Tool -> Service migration is an opportunity
