

FLUKA estimation of DPA for ion irradiation and update on IR7 DPA calculations for LHC operations

E. Skordis

On behalf of the FLUKA and Collimation teams

FLUKA for GSI

➤ FLUKA: General purpose particle physics MonteCarlo code used for machine protection, design studies, R2E, activation, collimation -> simulates particle interaction with matter

- relative change of average resistivity for the whole ion range ~ 35 μm)

MG6530 (long fibers, no Ti)

Courtesy of Dr. Marilena Tomut (GSI)

LHC collimation system

- Capable of redirecting up to 500kW of proton loss rate in order to protect the Super Conducting Magnets from quenching (stop being SC due to energy deposition -> increase in temperature)
- 99% of that power is deposited in the whole IR7 and IR3
- **Not** all power is absorbed by the collimators themselves

Collimation losses simulation overview

- Simulation tools used:

Sixtrack and FLUKA are simulation tools regularly used at CERN to perform LHC studies.

- **SIXTRACK** : Single particle 6D tracking code for long term tracing in high energy rings -> complemented with dedicated interaction routines, predicts losses in collimators.
- **FLUKA**: General purpose particle physics MonteCarlo code used for machine protection, design studies, R2E, activation, collimation -> simulates particle interaction with matter
- **SIXTRACK-FLUKA coupling**: Sixtrack tracking capabilities utilising the FLUKA particle matter interaction models

Comparison of the two methods of loading collimation losses in FLUKA

- Creating input for further FLUKA simulations

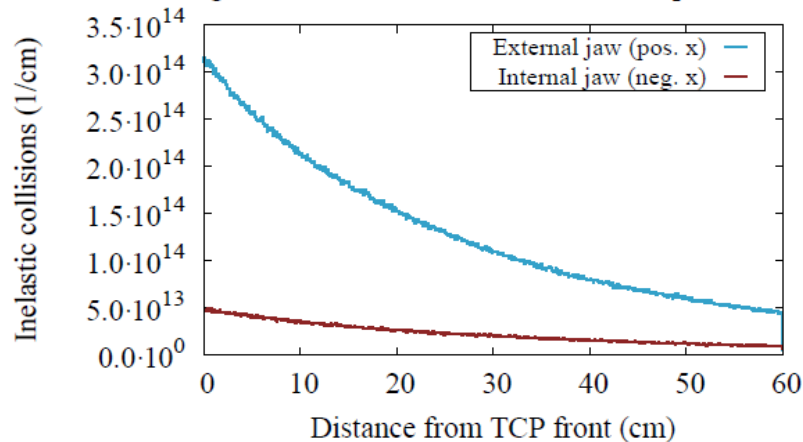

Old method: Lossmap of proton inelastic interactions inside the collimators. Primary non-inelastic interactions missing.

Spatial distribution of inelastic proton collisions in the horizontal TCP

Tracking results from P. Garcia Ortega.

Long. loss distr. in TCP.C6L7 (1.15×10^{16} protons lost)

Impact parameters in TCP.C6L7 (1.15×10^{16} protons lost)

→ tracking simulations show unequal sharing of losses between TCP.C6L7 jaws ($\sim 6:1$)

Comparison of the two methods of loading collimation losses in FLUKA

- Creating input for further FLUKA simulations

Old method: Lossmap of proton inelastic interactions inside the collimators. Primary non-inelastic interactions missing.

New method: Sixtrack-FLUKA Coupling provides “lossmap” of proton impacts on collimator surface (Touches)

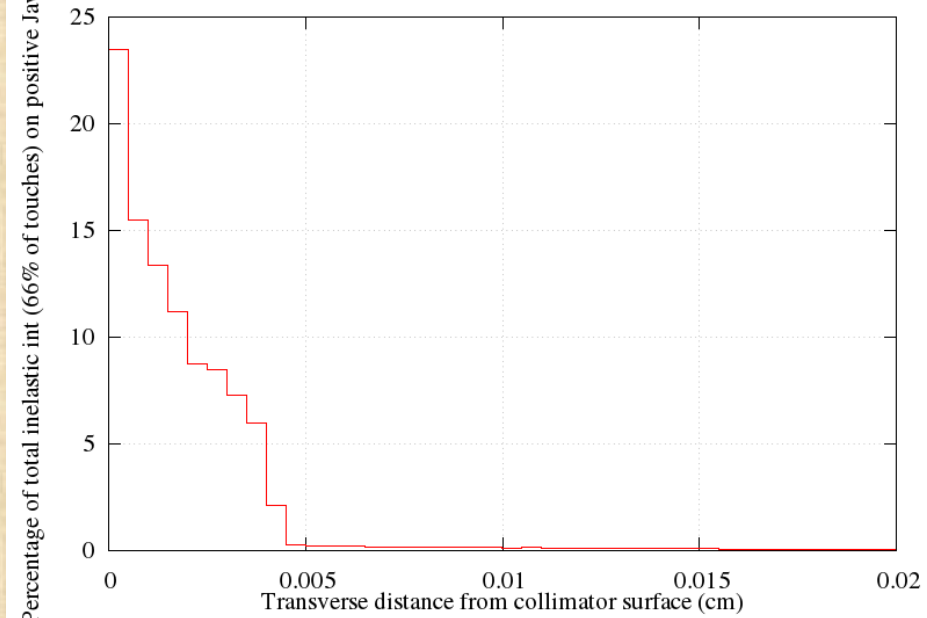

- 7 TeV - Nominal collimator settings – TCP at 6σ

TCP Hor -Touches-'lossmap' distribution in X - 7TeV Protons Nominal Coll Set

All losses located at the front face of the col.

TCP Hor Inelastic distribution in X - 7TeV Protons Nominal Coll Set

Losses distributed over the length of the col.

Energy deposition simulation requirements for collimation losses

1. Creating input for further FLUKA simulations

Old method: Sixtrack simulations produce lossmap of proton inelastic interactions in the collimators

New method: Sixtrack-FLUKA Coupling provides input (lossmap of inelastic interactions or proton impacts on collimator surface)

2. FLUKA simulation set up

– Model complex geometries of all key elements of the LHC

– Set up the simulation parameters

- Source routine
- Magnetic fields routines
- Physics settings
- Scoring
- Etc...

IR7 2013 Collimation Quench Test FLUKA – Sixtrack Simulations

Useful dimensions and coordinate system

Longitudinal distance from collimator center (z)
 $-30 < z < 30$ (cm)

Transverse distance from collimator surface (x)
 $0 < x < 0.04$ (cm)

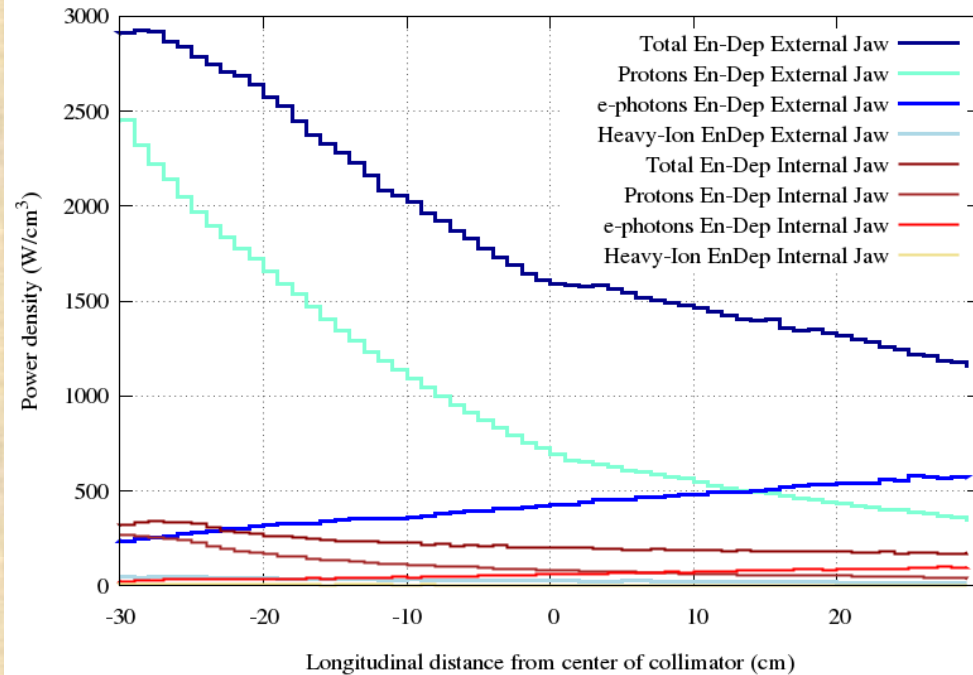

External = Positive Jaw
Internal = Negative Jaw

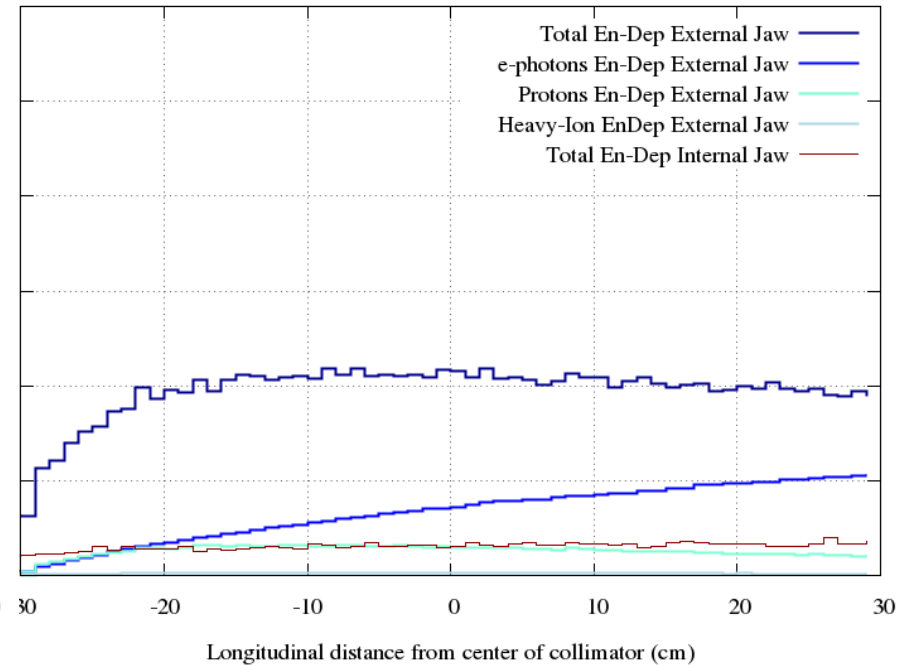

Peak power density over z for $5 \times 5 \mu\text{m}^2$ bin size

500kW of 7 TeV/p = 4.5×10^{11} p/s

TCP Hor -Touches- Energy Density Peak $5 \times 5 \mu\text{m}^2$ - 500kW 7TeV Protons

TCP Hor -Inelastic- Peak Energy Density bin size $5 \times 5 \mu\text{m}^2$ in xy 500kW 7 TeV/p

- The remaining energy deposition is attributed to other charged particles (i.e. Pions)

- Difference of a factor of 2.5-3 attributed to ionising energy loss of the primary protons

Total Power deposited in both Jaws: 3kW

Peak power density over X for $5 \times 5 \mu\text{m}^2$ bin size

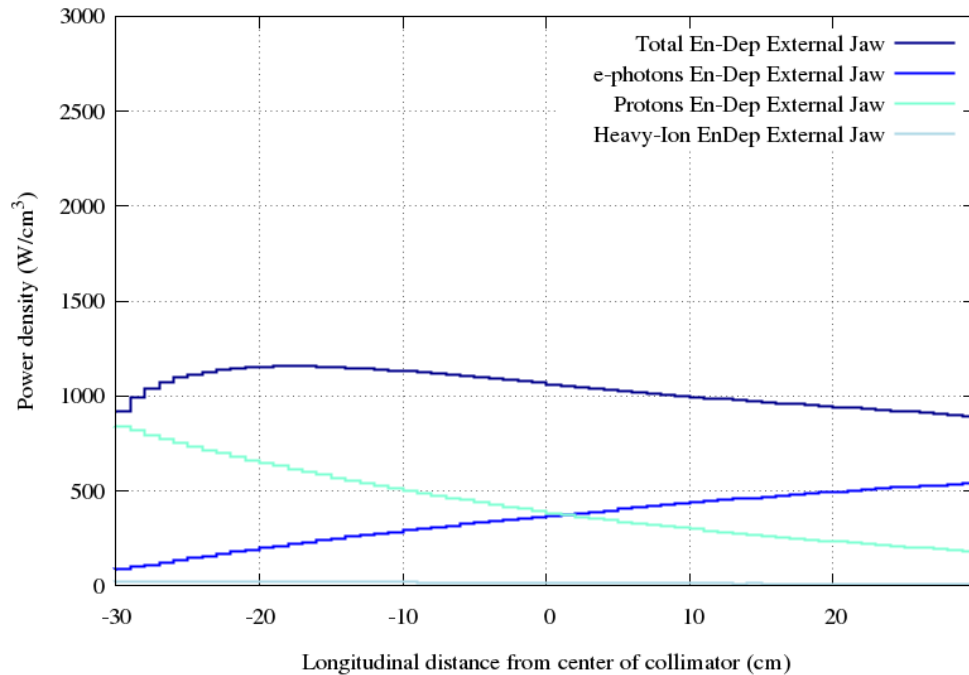

- Strong surface effect especially on the first 5um in X

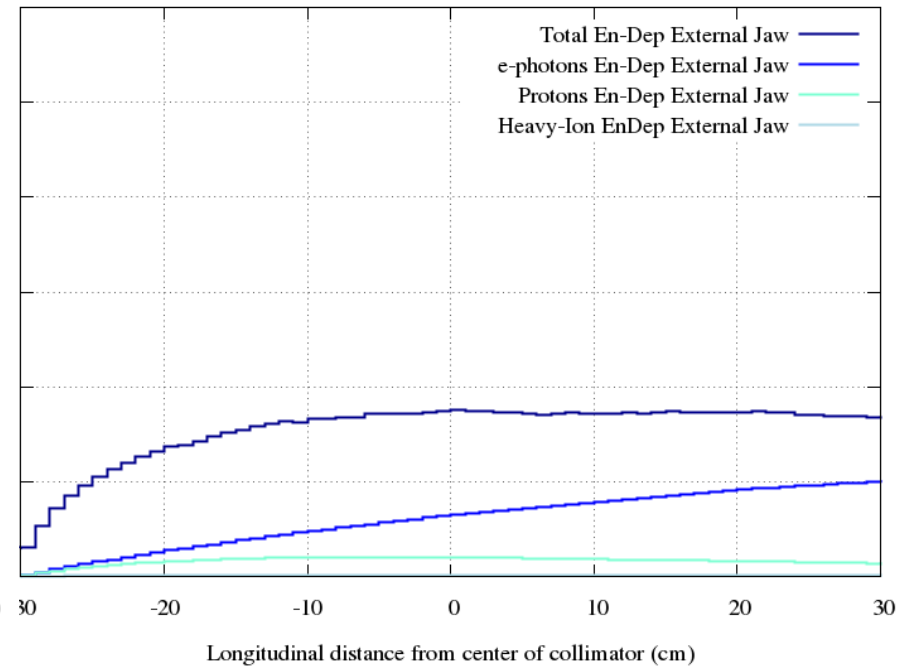

Peak power density over Z for 50x50 μm^2 bin size

500kW of 7 TeV/p = 4.5e11p/s

TCP Hor -Touches- Peak Energy Density Average 50x50 μm^2 in xy Lossrate 4.5e11 p/s

TCP Hor -Inelastic- Energy Density averaged 50x50 μm^2 in xy Lossrate 4.5e11 p/s

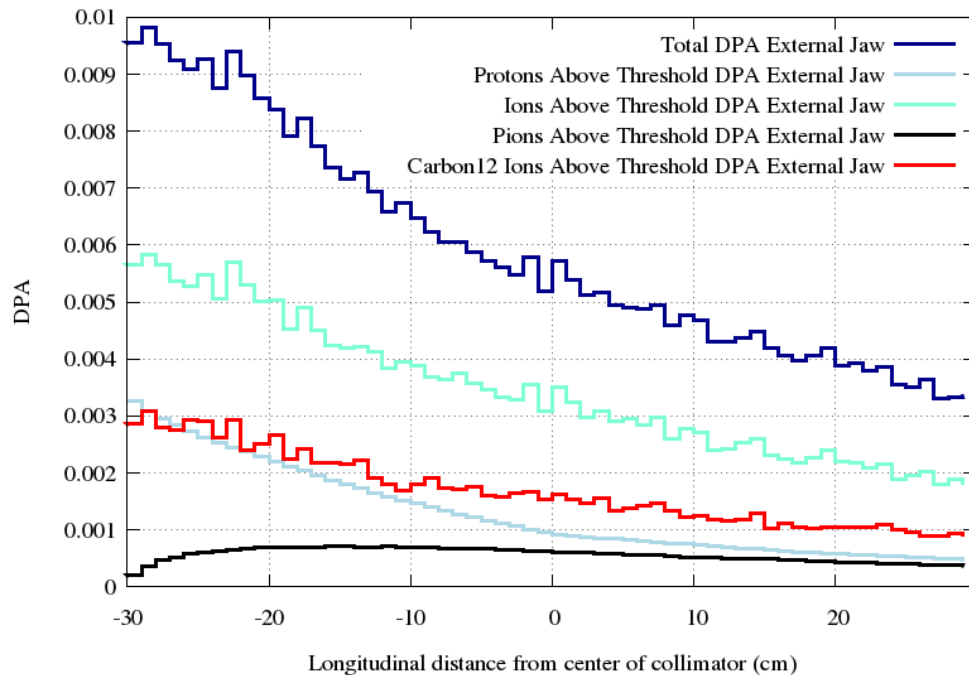

- Less pronounced peak increase when averaging the energy deposition over 50 μm in x and y
- Increase of roughly a factor of 30%

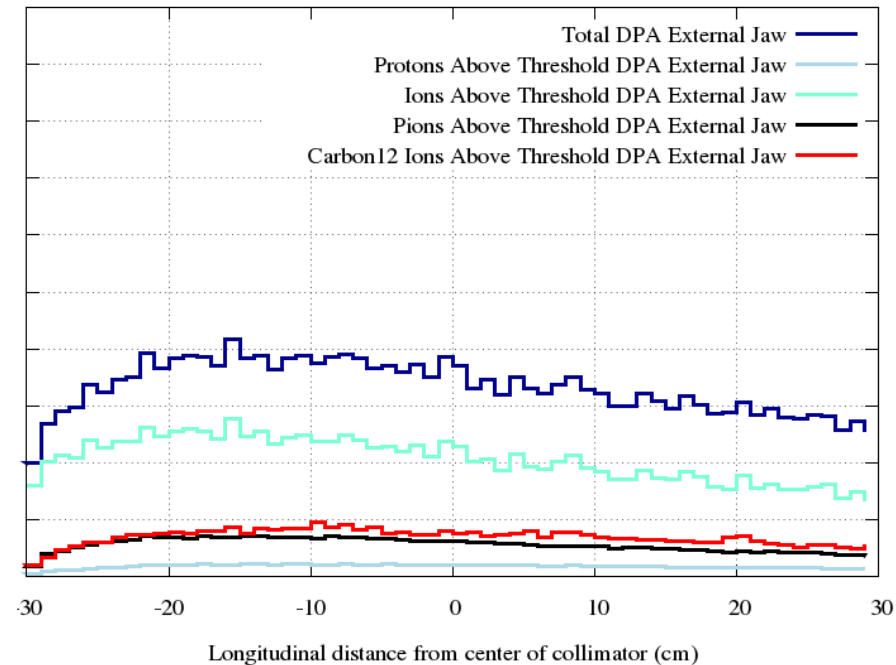

Total Power deposited in both Jaws: 3kW

Peak DPA over Z for $5 \times 5 \mu\text{m}^2$ bin size

TCP Hor -Touches- DPA $5 \times 5 \mu\text{m}^2$ in xy Integrated losses of 1.15×10^{16} p

TCP Hor -Inelastic- DPA $5 \times 5 \mu\text{m}^2$ in xy Integrated losses of 1.15×10^{16} p

- Carbon 12 contribution included in the Ions!

$$1.15 \times 10^{16} \text{ p} \approx 30\text{-}40 \text{ fb}^{-1}$$

$$\text{Area of impact } 0.005 \times 0.1 = 5 \times 10^{-4} \text{ cm}^2$$

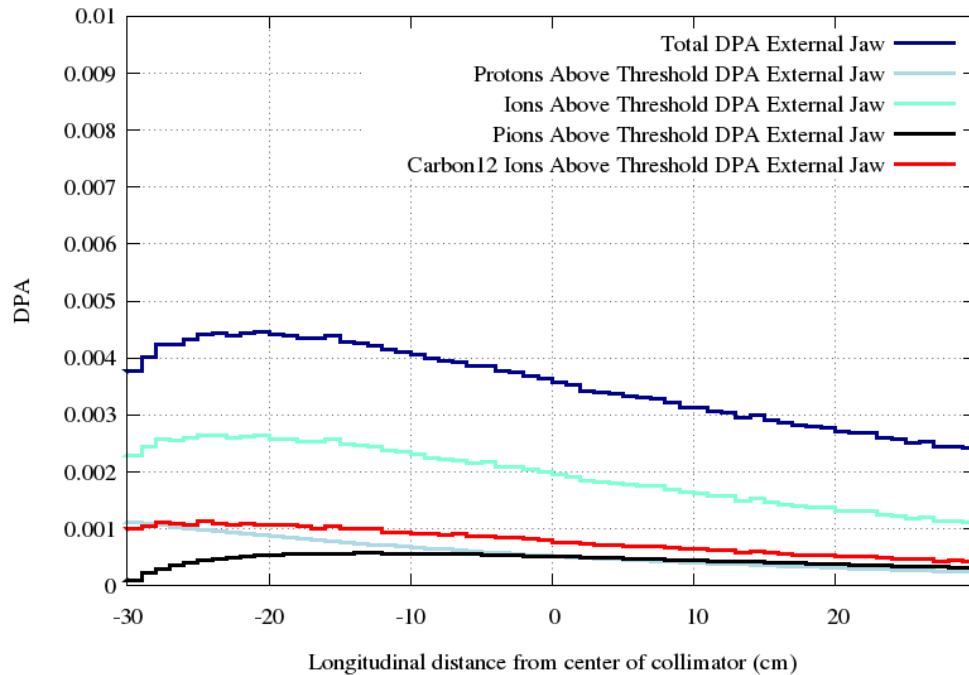

$$\text{Multipass factor} = 1.5 - \text{Fluence} = 3.45 \times 10^{19} \text{ p/cm}^2$$

a factor of ~ 100 more for HL-LHC

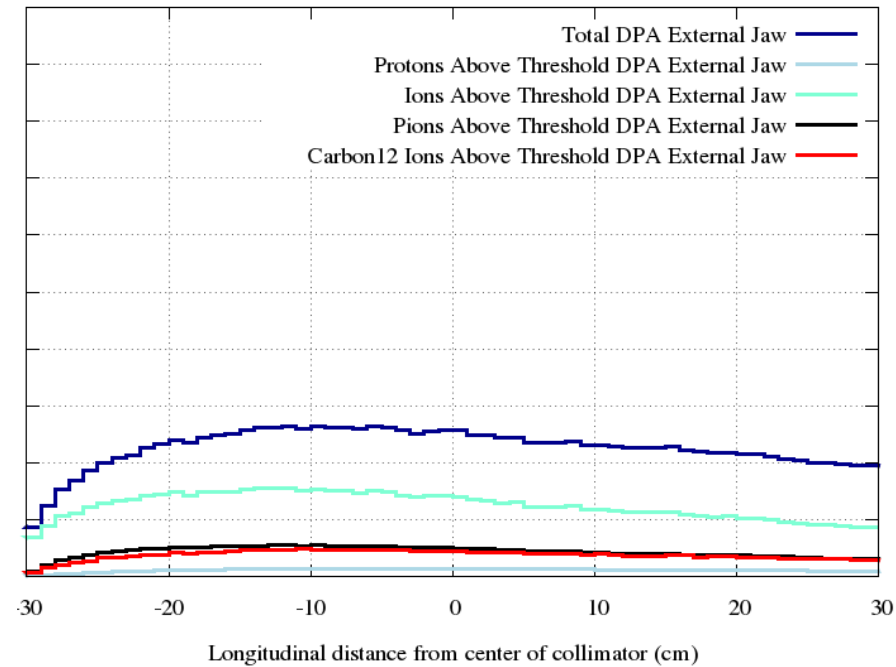

- Difference attributed in the Coulomb scattering of primary protons and Carbon 12 Ions originating from nuclear elastic interactions of primary protons

Peak DPA over Z for 50x50 μm^2 bin size

TCP Hor -Touches- DPA average 50x50 μm^2 in xy Integrated losses of 1.15e16 p

TCP Hor -Inelastic- DPA 50x50 μm^2 in xy Integrated losses of 1.15e16 p

- Carbon 12 contribution included in the Ions!

1.15e16p \approx 30-40 fb $^{-1}$
a factor of \sim 100 more for HL-LHC

- Less pronounced peak increase when averaging the energy deposition over 50 μm in x and y
- Increase of roughly a factor of 60%

Simulation Settings for TCSG.A6R7

- Beam energy: 6.5 TeV – Beam 2
- Nominal collimator settings used in 2015 operation – TCP at 5.5σ / TCSG at 8.0σ
- Two materials considered:
 - a. Graphite – density: 1.67 g/cm^3
 - b. MoGR6400 – density: 2.48 g/cm^3

Peak power density over z for $1 \times 1 \text{mm}^2$ bin size

500kW of 6.5 TeV/p = $4.85 \times 10^{11} \text{p/s}$

TCSG Skew - GRAPHITE - Energy Density Peak $1 \times 1 \text{mm}^2$ - 500kW 6.5TeV Protons

TCSG Skew - MoGR - Energy Density Peak $1 \times 1 \text{mm}^2$ - 500kW 6.5TeV Protons

Total Power deposited in both Jaws
for GRAPHITE: 15kW

Total Power deposited in both Jaws
for MoGR: 37.5kW

- The remaining energy deposition is attributed to other charged particles (i.e. Pions, Kaons)

Peak DPA over z for 1x1mm² bin size

TCSG Skew - GRAPHITE - DPA 1x1mm² in xy Integrated losses of 1.15e16 p - 6.5T

TCSG Skew - MoGR - DPA 1x1mm² in xy Integrated losses of 1.15e16 p

1.15e16p \approx 30-40 fb⁻¹
a factor of \sim 100 more for HL-LHC

DPA x-sec for MoGR for $1 \times 1 \text{ mm}^2$ bin size

$1.15 \times 10^{16} \text{ p} \approx 30\text{-}40 \text{ fb}^{-1}$
a factor of ~ 100 more for HL-LHC

Conclusions

- A. Effect of the nuclear elastic and EM interactions of primary proton assessed on the TCP
 - Energy density and DPA peak increased by a factor of 2-3 in comparison to the old method
 - ANCYS calculations may be needed for further evaluation of the importance of the strong surface effect
- B. Considerations for HL-LHC for $\sim 4000\text{fb}^{-1}$ requires a scale of the presented results by a factor of ~ 100
 - Peak DPA on TCP.C approaches 1 on the 5-10 μm layer in x with a width of 200 μm in y
 - For the most impacted secondary TCSG.A6R7 average values of DPA will range between $1\text{e-}3$ for GRAPHITE to $3\text{e-}3$ for MoGR.

Thank you!

BACK UP SLIDES

DPA in TCP jaws (1.15×10^{16} protons lost) – preliminary resultsAssumed E_{thr} (AC150): 35 eVMax. DPA: $\sim 3 \times 10^{-3}$

Transp. thre.	
photons	100 keV
e^-/e^+	500 keV
neutrons	10^{-5} eV
ions	0.25 keV/nucl
other	1 keV

Validation of dose calculations for TeV proton losses (controlled beam loss experiments)

- FLUKA is based, as far as possible, on well benchmarked microscopic models
- However, first years of LHC operation also allowed to validate FLUKA dose predictions against Beam Loss Monitors (BLMs) measurements
- BLMs measure dose from secondary showers in machine elements (magnets, collimators, etc.)
- Several thousand BLMs are installed around the ring (ICs, filled with N_2 gas, about 1500 cm^2 active vol.)

Losses induced by beam wire scanner (p@3.5 TeV)

- Quench test 2010 in LHC IR4 (M. Sapinski et al.)
- Wire scans: showers due to collision products registered in BLMs installed on downstream magnets (~ 35 from wire scanner)

Absolute comparison!

N_i = number of inelastic proton-wire interactions (derived analytically)

Direct losses on MQ beam screen[†] (p@4 TeV)

- Quench test 2013 in arc sector 56 (A. Priebe et al.)
- Proton losses on beam screen (over ~ 1.5 m) by means of orbit bump/beam excitation, dose measured by BLMs outside of MQ cryostat

Absolute comparison! (N_p = number of lost protons (measured))

[†] FLUKA simulations based on MAD-X loss distribution from V. Chetvertkova et al.
