## Measurements of the CP violating phase $\phi_s$ at LHCb

*Tuesday 16 May 2017 15:45 (15 minutes)*

The measurement of the mixing-induced CP-violating phase  $\phi_s$  in the  $B_s$ - $B_s^*$  system is one of the key goals of the LHCb experiment. It has been measured exploiting the Run I data set, using several decay channels. The poster shows the most recent results obtained analyzing  $B_s^0 \rightarrow J/\psi K^+ K^-$  candidates in the  $K^+ K^-$  mass region above the  $\phi(1020)$  resonance. The poster also shows previous measurements using the same final state with the  $K^+ K^-$  mass at the  $\phi(1020)$ , as well as using the  $B_s^0 \rightarrow J/\psi \pi^+ \pi^-$  decays. Finally, a combination of the various results is presented.
