# Introduction

- ▶ Today's presentation goals
  - ▶ Present our proposal
  - ▶ Get feedback before implementing it in a branch
  
- ▶ In most cases, no « right » or « wrong »
  - ▶ Question of taste, experience, etc...
  - ▶ Consensus

# Principles (1)

(order conveys no information)

1. A module is a set of code closely related and sharing an interface that can result in one or more libraries.
2. We favour extracting large common modules to their own repositories.
3. AliceO2 is a thin repo containing
  - ▶ Detector specific code
  - ▶ Commonalities
  - ▶ Global algorithms
4. The AliceO2 repo has a mixture of « per detector » and « per function » sub-modules with corresponding sub-structure

# Principles (2)

(order conveys no information)

5. Dependencies are defined centrally as buckets .
6. Each sub-module generates a single library linked against the dependencies defined in a single bucket.
7. Sub-modules' executable(s) link against the same bucket as the library and the library itself.
8. Horizontal dependencies are in general forbidden (between sub-modules at the same level)
9. Naming : camel-case
  - ▶ What is repeated / structural starts with a lower case letter (e.g. src, include, test)
  - ▶ The rest (labels, unique names) start with an upper case letter (e.g. Common, Detectors)

# Example repo

## Repo organisation

- ▶ AliceO2

- ▶ cmake

- ▶ O2Dependencies.cmake

- ▶ O2Utils.cmake

- ▶ Common

- ▶ DataFormats

- ▶ Detectors

- ▶ GlobalReconstruction

- ▶ CMakeLists.txt

Dependencies and Buckets definition

Macro and functions definitions

Commonalities

Detectors specific

Functionality based

Project definition (only)

<https://github.com/Barthelemy/o2-repo-org-test/tree/cmake-barth>

# O2Dependencies.cmake

## # Packages

```
find_package(  
    Boost  
    COMPONENTS  
        unit_test_framework program_options  
    REQUIRED  
)  
include_directories( ${Boost_INCLUDE_DIRS} )
```

## # Buckets definition

```
o2_define_bucket(  
    NAME  
        GlobalTracking_Bucket  
    DEPENDENCIES  
        Common  
        ${Boost_PROGRAM_OPTIONS_LIBRARY}  
)
```

# O2Utils.cmake

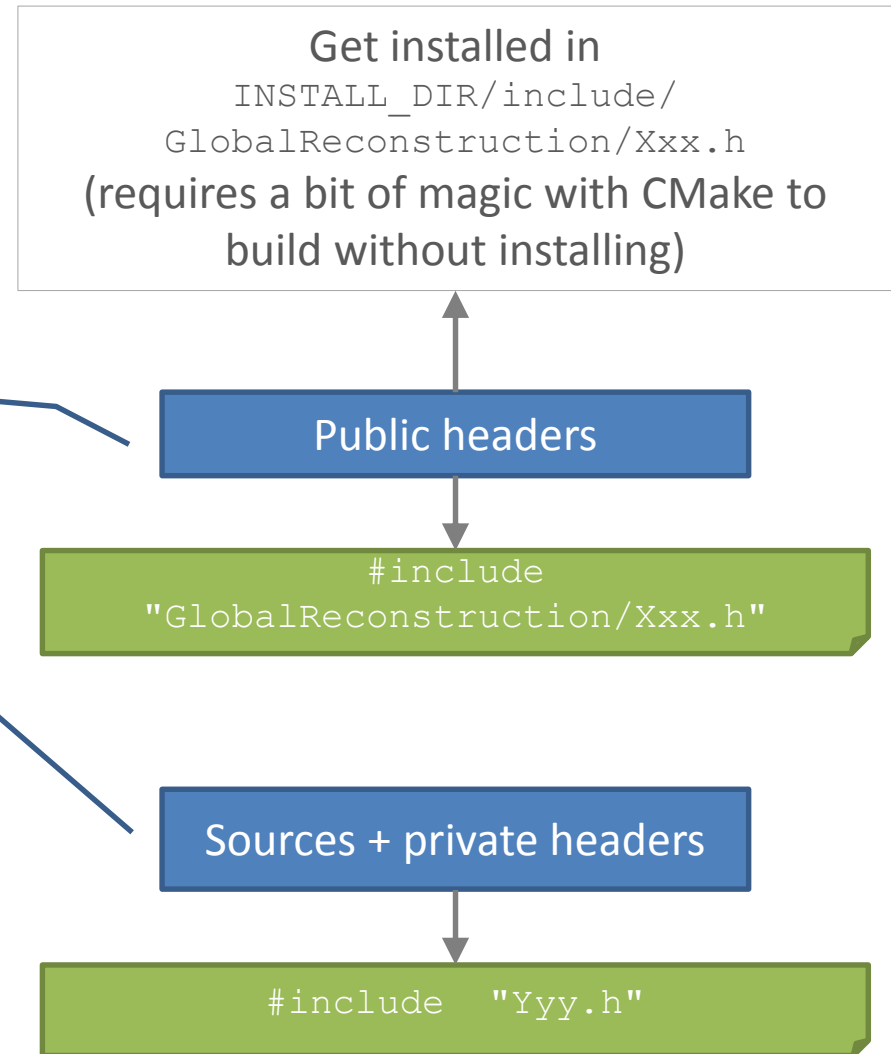

- ▶ `macro(o2_define_bucket)`
  - ▶ Used in O2Dependencies
- ▶ `macro(o2_target_link_bucket)`
  - ▶ Used in users' code, same as `target_link_library`

# Example repo

## Structure details (functionality based sub-module)

### ► GlobalReconstruction

- cmake
- doc
- include
  - Something.h
- src
  - Something.cxx
  - PrivateHeader.h
- test
- CMakeLists.txt

# Example repo

## Magic for the headers

### ▶ In AliceO2/CMakeLists.txt

```
# function to pre-install all headers in the build directory  
pre_install_o2_includes()  
# make it available to the sub-modules  
include_directories(${CMAKE_BINARY_DIR}/include)
```

### ▶ In AliceO2/GlobalReconstruction/src/Something.cxx

```
#include "Common/base.h"  
#include "PrivateHeader.h" // in same module
```

# Example repo

## CMakeLists.txt of a sub-module

### ▶ # Define the library

```
add_library(${LIBRARY_NAME} SHARED ${LIB_SOURCES})
```

### ▶ # Link against a bucket

```
o2_target_link_bucket(TARGET ${LIBRARY_NAME}  
                      BUCKET "GlobalTracking_Bucket")
```

### ▶ # Define application

```
add_executable(${APPLICATION_NAME} ${APP_SOURCES})
```

### ▶ # Links the application against the bucket

```
o2_target_link_bucket(TARGET ${APPLICATION_NAME}  
                      BUCKET "GlobalTracking_Bucket")  
target_link_libraries(${APPLICATION_NAME} ${LIBRARY_NAME})
```

# Example repo

## Structure details (detectors based sub-modules)

- ▶ Detectors
  - ▶ ITS
    - ▶ reconstruction
      - ▶ <same as previous slide>
    - ▶ simulation
      - ▶ <same as previous slide>
    - ▶ base
      - ▶ <same as previous slide>
  - ▶ TPC
    - ▶ reconstruction
      - ▶ More sub-folders...
    - ▶ simulation
      - ▶ <same as previous slide>

Each one is a sub-module

# Extra notes

- ▶ Extracted modules in AliceO2 group follow the same principles and in particular
  - ▶ Coding guidelines
  - ▶ General structure
  - ▶ 1 lib per sub-module
- ▶ Need scripts to create new modules and submodules
- ▶ Global definitions in O2Utils.cmake

# Next steps

- ▶ Reorganize AliceO2
  - ▶ Add directories such as Tutorial, Topologies, ...
  - ▶ Regroup and split
  - ▶ Rename
- ▶ Apply dependencies principles to AliceO2
  - ▶ Modify CMakeLists.txt
- ▶ Add examples for documentation and tests
- ▶ Boiler code -> remove/extract
- ▶ Write scripts / template to generate new modules

# Feedback

- ▶ Time for questions and feedback
