

Cyclotrons II - Outline

- brief review of the previous lesson
- cyclotron subsystems
Injection/extraction schemes, RF systems/resonators, magnets, vacuum issues, instrumentation
- applications and examples of existing cyclotrons
TRIUMF, RIKEN SRC, PSI Ring, PSI medical cyclotron
- discussion
classification of circular accelerators, cyclotron vs. FFAG,
Pro's and Con's of cyclotrons for different applications

review of Cyclotrons-I

classical cyclotron

- simplicity, compactness
- continuous injection/extraction
- multiple usage of accelerating voltage

but:

- insufficient vertical focusing
- limited energy reach

sector cyclotron

$$v_z^2 = -\frac{R}{B_z} \frac{dB_z}{dR} + F^2(1 + 2 \tan^2 \delta)$$

flutter spiral angle
 ↙ ↓

next: **injection & extraction**

- spiral inflector, internal source, electrostatic deflectors, stripping

injection schemes – spiral inflector

- an electrostatic component, basically a capacitor
- E-field arranged perpendicular to orbit, particles move on equipotential surfaces

simulation of orbits injected through a spiral inflector

[inflector IBA Cyclone 30 cyclotron]

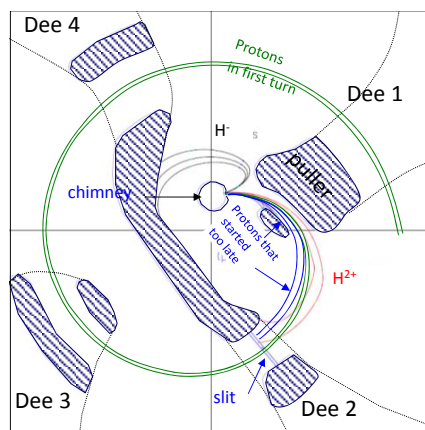

[courtesy: W.Kleeven (IBA)]

internal ion source

→ example COMET

- Hydrogen is injected and ionized through chimney
- first acceleration by puller, connected to one Dee (80kV)

chimney = ion source
deflector electrode for intensity regulation

electrostatic septum and charge exchange extraction

- deflecting element should affect just one turn, not neighbored turn → critical, cause of losses
- often used: electrostatic deflectors with thin electrodes
- alternative: charge exchange, stripping foil; accelerate H^- or H_2^+ to extract protons (problem: significant probability for unwanted loss of electron; Lorentz dissociation: B-field low, scattering: vacuum 10^{-8} mbar)

extraction electrode placed between turns

foil

binding energies	
H^-	H_2^+
0.75eV	15eV

eg.: $H^- \rightarrow H^+$
 $H_2^+ \rightarrow 2H^+$

injection/extraction with electrostatic elements

principle of extraction channel

parameters extraction chan.:
 $E_k = 590\text{MeV}$
 $E = 8.8\text{ MV/m}$
 $\theta = 8.2\text{ mrad}$
 $\rho = 115\text{ m}$
 $U = 144\text{ kV}$

major loss mechanism is scattering in $50\mu\text{m}$ electrode!

electrostatic rigidity:

$$E\rho = \frac{\gamma + 1}{\gamma} \frac{E_k}{q}$$

extraction foil

- thin foil, for example carbon, removes the electron(s) with high probability
- new charge state of ion brings it on a new trajectory → separation from circulating beam
- lifetime of foil is critical due to heating, fatigue effects, radiation damage
- conversion efficiencies, e.g. generation of neutrals, must be considered carefully

electrons removed from the ions spiral in the magnetic field and may deposit energy in the foil

How much power is carried by the electrons?

→ velocity and thus γ are equal for p and e

$$E_k = (\gamma - 1)E_0$$

$$\rightarrow E_k^e = \frac{E_0^e}{E_0^p} E_k^p = 5.4 \cdot 10^{-4} E_k^p$$

Bending radius of electrons?

$$\rho^e = \frac{E_0^e}{E_0^p} \rho^p$$

→ typically mm

example: multiple H⁻ stripping extraction at TRIUMF

example: H_2^+ stripping extraction in planned
Daedalus cyclotron [neutrino source]

purpose: pulsed high
power beam for neutrino
production

- 800MeV kin. energy
- 5MW avg. beam power

[L.Calabretta,
A.Calanna et al]

11

next: **RF, magnets, vacuum, diagnostics**

12

components: sector cyclotron resonators

cyclotron resonators are basically box resonators
 resonant frequency:

$$f_r = \frac{c}{2} \sqrt{\frac{1}{a^2} + \frac{1}{l^2}}$$

beam passes in center plane;
 accelerating voltage varies as $\sin(r)$

cross sections of PSI resonators

original Al-Resonator
 Oper. freq. = 51 MHz
 Max. gap voltage = 760 kV
 Power dissipation = 320 kW
 Q0 = 32'000 (meas. value)

new Cu-Resonator
 Oper. freq. = 51 MHz
 Max. gap voltage > 1MV
 Power dissipation = 500 kW
 Q0 ≈ 48'000

copper resonator in operation at PSI's Ring cyclotron

- $f = 50.6\text{MHz}$; $Q_0 = 4,8 \cdot 10^4$; $U_{\text{max}} = 1.2\text{MV}$ (presently 0.85MV)
- transfer of up to **400kW power to the beam** per cavity
- Wall Plug to Beam Efficiency (RF Systems): **32%**

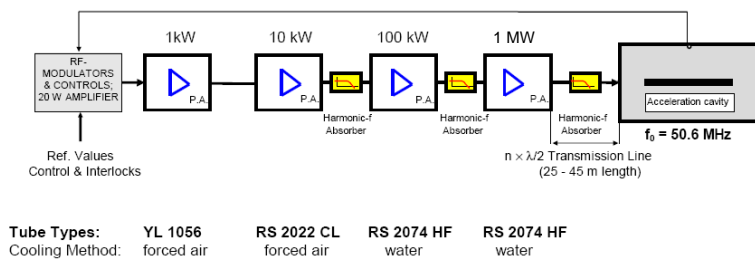

resonator inside hydraulic tuning devices (5x)

50 MHz 1 MW amplifier chain for Ring cyclotron

4- STAGE POWER AMPLIFIER CHAIN, EMPLOYING POWER TETRODE TUBES

Wall Plug to Beam Efficiency (RF Systems): **32%**
 [AC/DC: 90%, DC/RF: 64%, RF/Beam: 55%]

[L.Stingelin et al]

cyclotron technology: sector magnets

cyclotron magnets typically cover a wide radial range → magnets are heavy and bulky, thus costly

PSI sector magnet

iron weight: 250 tons
 coil weight: 28 tons
 Field: 2.1T
 orbit radius: 2.1...4.5 m
 spiral angle: 35 deg

Riken SRC sector magnet

weight: 800 tons
 Field: 3.8T, 5000A
 orbit radius: 3.6...5.4m

Magnets – Fine-tuning with trim coils

- isochronicity depends critically on exact field distribution
- circulation time is measured with phase probes and field shape is adjusted using radially distributed trim coil circuits

example: AGOR cyclotron in Groningen NL

vacuum in cyclotrons – proton losses from scattering

- losses are caused by inelastic scattering at residual gas molecules, use inelastic reaction cross section to estimate losses, convert to mean free path
- compute pressure for 10^{-5} relative loss

common gases, protons :
 (atmospheric conditions)

$\lambda_{inel}(\text{air})$	=	747m
$\lambda_{inel}(\text{CO})$	=	753m
$\lambda_{inel}(\text{H}_2)$	=	6110m
$\lambda_{inel}(\text{Ar})$	=	704m

mean free path:
$$\lambda_{eff} = \left(\frac{1}{P_0} \sum \frac{P_i}{\lambda_{inel}^i} \right)^{-1}$$

beam loss:
$$\frac{N_0 - N(l)}{N_0} = 1 - \exp(-l/\lambda_{eff}) \approx l/\lambda_{eff}$$

pressure for loss $< 10^{-5}$: $P_{(air)} < 10^{-3}$ mbar \rightarrow easy, vacuum no problem for p losses!

heavy ion induced gas desorption

demonstration of transmission breakdown by gas desorption

[measurements in AGOR cyclotron, KVI-Groningen, S.Brandenburg et al]

- transmission of $^{40}\text{Ar}^{5+}$ 8 MeV per nucleon
- base vacuum 3×10^{-7} mbar
- injected intensity up to 6×10^{12} pps
- beampower: ≤ 320 W

comments on cyclotron vacuum system

- vacuum chamber with large radial width → difficult to achieve precisely matching sealing surfaces → noticeable leak rates must be accepted
- use cryo pumps with high pumping speed and capacity
- $\approx 10^{-6}$ mbar for p, $\approx 10^{-8}$ mbar for ions (instability! e.g. AGOR at KVI)
- design criterion is easy access and fast mountability (activation)

example: inflatable seals installed between resonators; length: 3.5m

length: 3.5m

cyclotron instrumentation

example: PSI 72MeV injector cyclotron

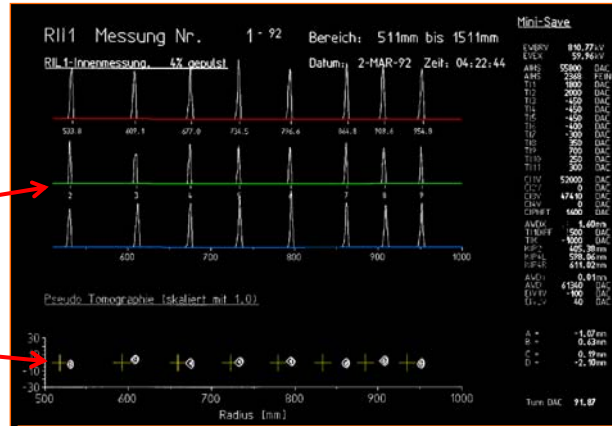

instrumentation: radial probe for turn counting / orbit analysis

wire scanner with three tilted wires delivers radial beam profile and some vertical information

radial: positions of individual turns

vertical/radial orbit positions and stored reference orbit (crosses)

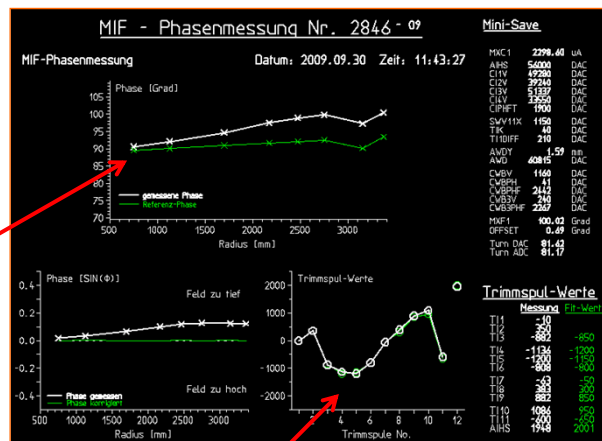

«pseudo tomography» with tilted wires

instrumentation: phase probes

phase probes are radially distributed RF pickups that detect the arrival time (phase) of bunches vs radius → adjustment of isochronicity

measured phase vs. radius; green: reference phase for «good conditions»

trim coil settings (12 circuits across radius) green: predicted from phase measurement

compact cyclotrons for Isotope production

Vertical setup

some cyclotrons

	TRIUMF	RIKEN SRC (supercond.)	PSI Ring	PSI medical (supercond.)
particles	H ⁻ → p	ions	p	p
K [MeV]	520	2600	592	250
magnets (poles)	(6)	6	8	(4)
peak field strength [T]	0.6	3.8	2.1	3.8
R _{inj} /R _{extr} [m]	0.25/3.8...7.9	3.6/5.4	2.4/4.5	-/0.8
P _{max} [kW]	110	1 (86Kr)	1300	0.25
extraction efficiency (tot. transmission)	0.9995 (0.70)	(0.63)	0.9998	0.80
extraction method	stripping foil	electrostatic deflector	electrostatic deflector	electrostatic deflector
comment	variable energy	ions, flexible	high intensity	compact

27

cyclotron examples: TRIUMF / Vancouver

photo: iron poles with spiral shape
($\delta_{\max}=70\text{deg}$)

- p, 520MeV, up to 110kW beam power
- diameter: 18m (largest n.c. cyclotron worldwide)
- extraction by stripping H⁻ → variable energy; multiple extraction points possible

28

example: RIKEN (Jp) superconducting cyclotron

K = 2,600 MeV
 Max. Field: 3.8T (235 MJ)
 RF frequency: 18-38 MHz
 Weight: 8,300 tons
 Diameter: 19m
 Height: 8m

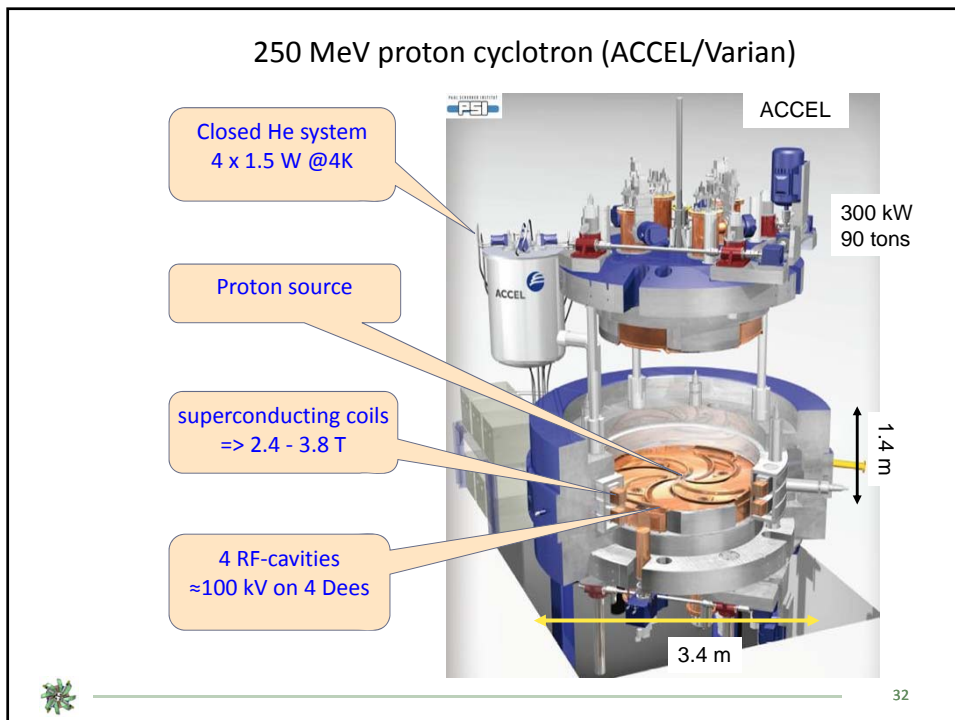

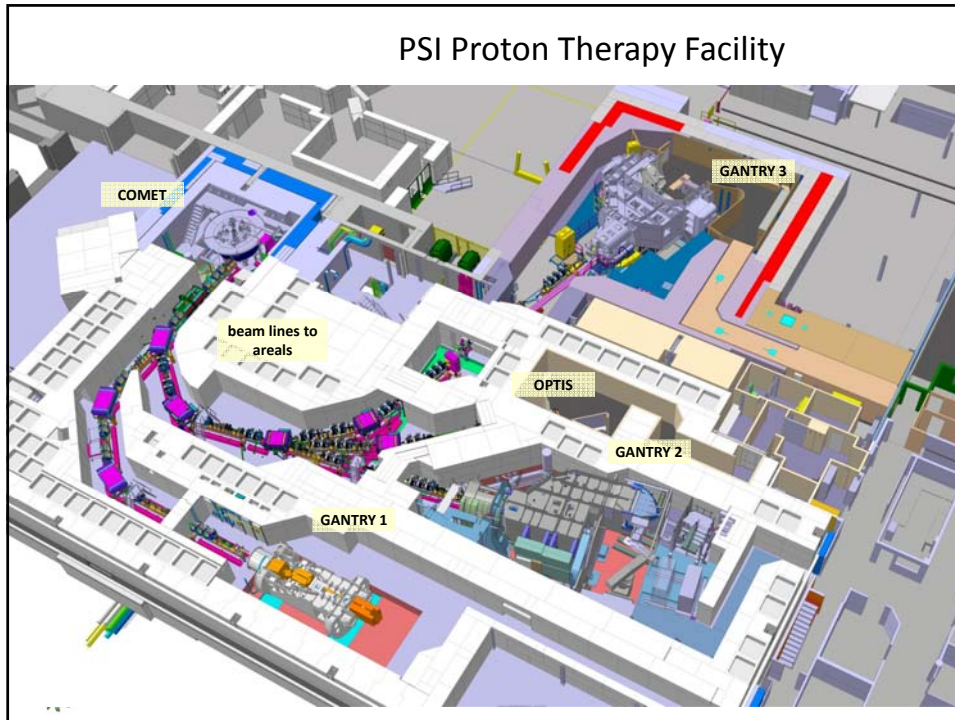

superconducting
 Sector Magnets :6
 RF Resonator :4
 Injection elements.
 Extraction elements.

utilization:
*broad spectrum of
 ions up to Uranium*

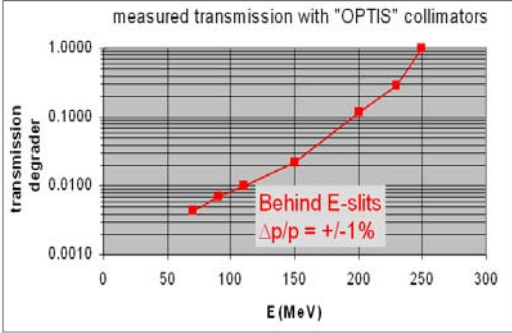

RIKEN SRC in the vault

Cyclotron needs degrader :

- cyclotron has fixed energy; need **degrader** for energies down to 70MeV
- collimation after degrader to keep emittance → lose intensity with degrader

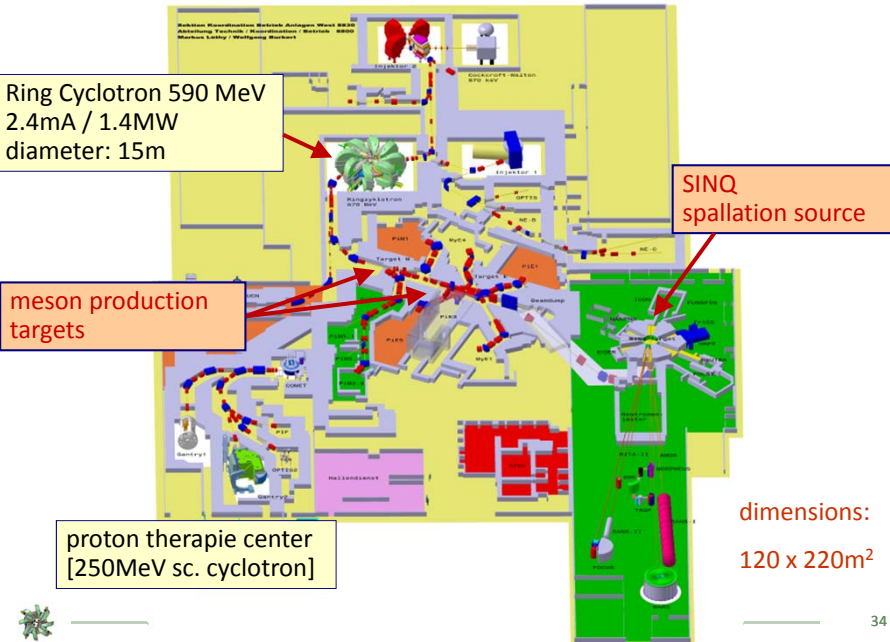

degrader: (carbon wedges in vacuum) and laminated beam line magnets for fast energy changes < 80 ms / step

M.Seidel, Cyclotrons - 33

examples: PSI High Intensity Proton Accelerator

34

finally: **discussion**

- comparison of circular accelerators
- cyclotron vs. FFAG
- suitability of cyclotrons
- some literature

classification of circular accelerators

	bending radius	bending field vs. time	bending field vs. radius	RF frequency vs. time	operation mode (pulsed/CW)	
betatron						induction
microtron						varying h
classical cyclotron						simple, but limited E_k
isochronous (AVF) cyclotron						suited for high power!
synchro-cyclotron						higher E_k , but low P
FFAG						strong focusing!
a.g. synchrotron						high E_k , strong focus

Cyclotron vs. FFAG

- many discussions on relation FFAG/Cyclotron;
e.g. a **synchro-cyclotron is actually an FFAG**
- in fact both concepts **can be distinguished via the dominating focusing mechanisms** (M.Craddock):

	Thomas cyclotron	sector FFAG
alternating B'	yes	yes
lens pattern	FFFFFF	FDFFD
edge focusing	dominant	negligible
AG focusing	negligible	dominant

37

pro and contra cyclotron

limitations of cyclotrons	typical utilization of cyclotrons
<ul style="list-style-type: none"> • energy limitation $\approx 1\text{GeV}$ due to relativistic effects • relatively weak focusing is critical for space charge effects (10mA ?) • tuning is difficult; field shape; many turns; limited diagnostics • wide vacuum vessel (radius variation) 	<ul style="list-style-type: none"> • medical applications $\leq 250\text{MeV}$; intensity range well covered • isotope production \rightarrow several 10MeV • acceleration of heavy ions (e.g. RIKEN) • very high intensity proton beams (PSI:1.4MW, TRIUMF: 100kW)

cyclotron conferences – a valuable source of knowledge

- old cyclotron conferences have been digitized for JACOW (effort of M.Craddock!)
- intl. cyclotron conference every 3 years; last month 2016 edition in Zürich; in-between European Cyclotron Progress Meeting (ECPM)
