

Charm production in DIS and the measurement of F_{2cc} at ZEUS

Tuesday, April 28, 2009 4:00 PM (15 minutes)

Charm production has been measured in the deep inelastic scattering regime with the ZEUS detector at HERA. Charm was reconstructed by identifying charmed mesons (D^* , D^+ , D_0) in the final state, or through its decay into muons. Differential cross sections were measured and compared to next-to-leading order QCD predictions. The charm contribution to the proton structure function F_2 , F_{2cc} , was extracted and compared with theoretical predictions using different parameterisations of the proton PDFs.
