

Preparing for a data-driven future to solve weather forecasting challenges

Innovation for change

CONTEXT

We live in a world where wind energy is becoming increasingly important...

Global Wind Energy Production

...and we know that our kids will rely in a world spinning on green energy

TECHNOLOGICAL CHALLENGE

PROBLEM

RES are not easily & well predictable

EX.: Today, wind predictions made 48-72 hours ahead are **still** innaccurate

On average, 5% error
At peaks, 20% error

Average distance between complete weather stations from national weather agencies

25 – 30 km

Lack of weather data points
Low integration of data

To improve energy production forecasting accuracy, we need more samples and a common platform for weather data

N° collecting points

Quantity & quality info

TECHNOLOGICAL CHALLENGE

What is the impact of bad wind forecasting?

GLOBAL

Unexploited
amount of green
energy

ENERGY BUSINESS

Higher production
costs
(20% of total cost linked to lack
in forecast accuracy)

CITIZENS

More expensive
bills

Low forecasting accuracy represents an additional **cost** at a
global, business and individual perspective

SOCIAL CHALLENGE

“People do not feel the need to share weather data”

1

**LOW
AWARENESS**

Not aware of how important forecasts are to improve efficiency in energy dispatchment

2

**NO
INCENTIVES**

No direct benefit seen in sharing this type of data

3

**NO
MEANS**

No existing platforms were to share and integrate weather data

In order to increase the amount of data samples,
we need a way to **FACILITATE**
weather data collection and sharing

OUR SOLUTION - PART 1

Start with schools a testing & promotional phase and scale-up to all strategically located institutions

A way to explore the world of energy and big data...

...and build science experiments...

...while receiving fundings for data collected and engaging kids on sustainability and green energy

OUR SOLUTION – PART 2

A NEW CONCEPT OF DATA COLLECTION & SHARING

Partnering with strategically-located and spread out entities on National ground

A new concept that will incentivize entities to contribute in collecting weather data

OUR BUSINESS MODEL

Enlarged
Network

Our platform

Weather forecasting
service businesses

Contributor
compensation

Business
subscription

Real-time local data + Data Repository

OUR VISION

SHARING THE PLANET AND SHARING DATA

Support a generation of people in being the key to solve global challenges, making them sensitive to weather prediction in a new, collaborative way

We all share the same planet, we should also share data in order to improve the quality of life. Weather forecasting is a crucial service that influences everyday life on several levels, and the energy business in particular.
