

RECENT OBSERVATIONS IN DIAMOND DETECTORS SIGNAL IN THE SPS EXTRACTION AND LHC INJECTION REGIONS

F. Burkart

for TE-ABT

with many inputs from M. Barnes, S. Bart Pedersen, T. Bohl, B. Dehning, L. Drosdal, E. Effinger, V. Kain, S. Sousa, R. Steerenberg, O. Stein

Outline

- Introduction dBLMs around LHC
- Measurement Results
- Loss Mitigation
- Current status of DAQ and Outlook

Acronyms for this presentation

dBLM – diamond based beam loss monitor

MKI – LHC injection kicker magnet

MKE – SPS extraction kicker magnet

MKP – SPS injection kicker magnet

TPSG – SPS septum protection

TDI – LHC injection protection absorber

Diamond detectors

- pCVD diamond based beam loss monitors, CIVIDEC.
- Active area: 1 cm².
- Thickness: 500 μm.
- E field strength: 1 V / μm.
- Nanosecond time resolution.
- Radiation hard.
- Rise time of 1 ns.
- Characterized between 1 – 1E8 MIPs.
- Can be installed at cryogenic temperatures.
- Vacuum compatibility.
- RF shielded.
- Can be used for beam based alignment.

Aim:

- Bunch-by-bunch loss data.
- Detect ghost bunches and RF – recapture at injection.
- Study UFOs.
- etc.

dBLMs around LHC

In total: 8 dBLMs.

- **Extraction losses at the PS** – position: installed close to **septum MU16**.
- **Extraction losses at the SPS** – position: installed close to **septum protection in LSS4 and LSS6**.
- **Injection losses at LHC** – position: IR2 and IR8, downstream of **TDI**.
- **Global losses** and post-mortem event recordings in **left and right IR7**, downstream TCPs.
- **Extraction losses at LHC** – position: IR6, downstream of **TCDQ**.
- **Transfer line losses** – position close to **TCDI** in T12 and T18 – **after the next TS**.

Close collaboration with BE-BI-BL, (Bernd Dehning et al.)

3 DAQs installed.

OASIS scope (PS)

Oscilloscope (IP2, IP6, IP7, IP8, SPS)

ROSY CIVIDEC, Scope and Histogram unit (IP4, IP7)

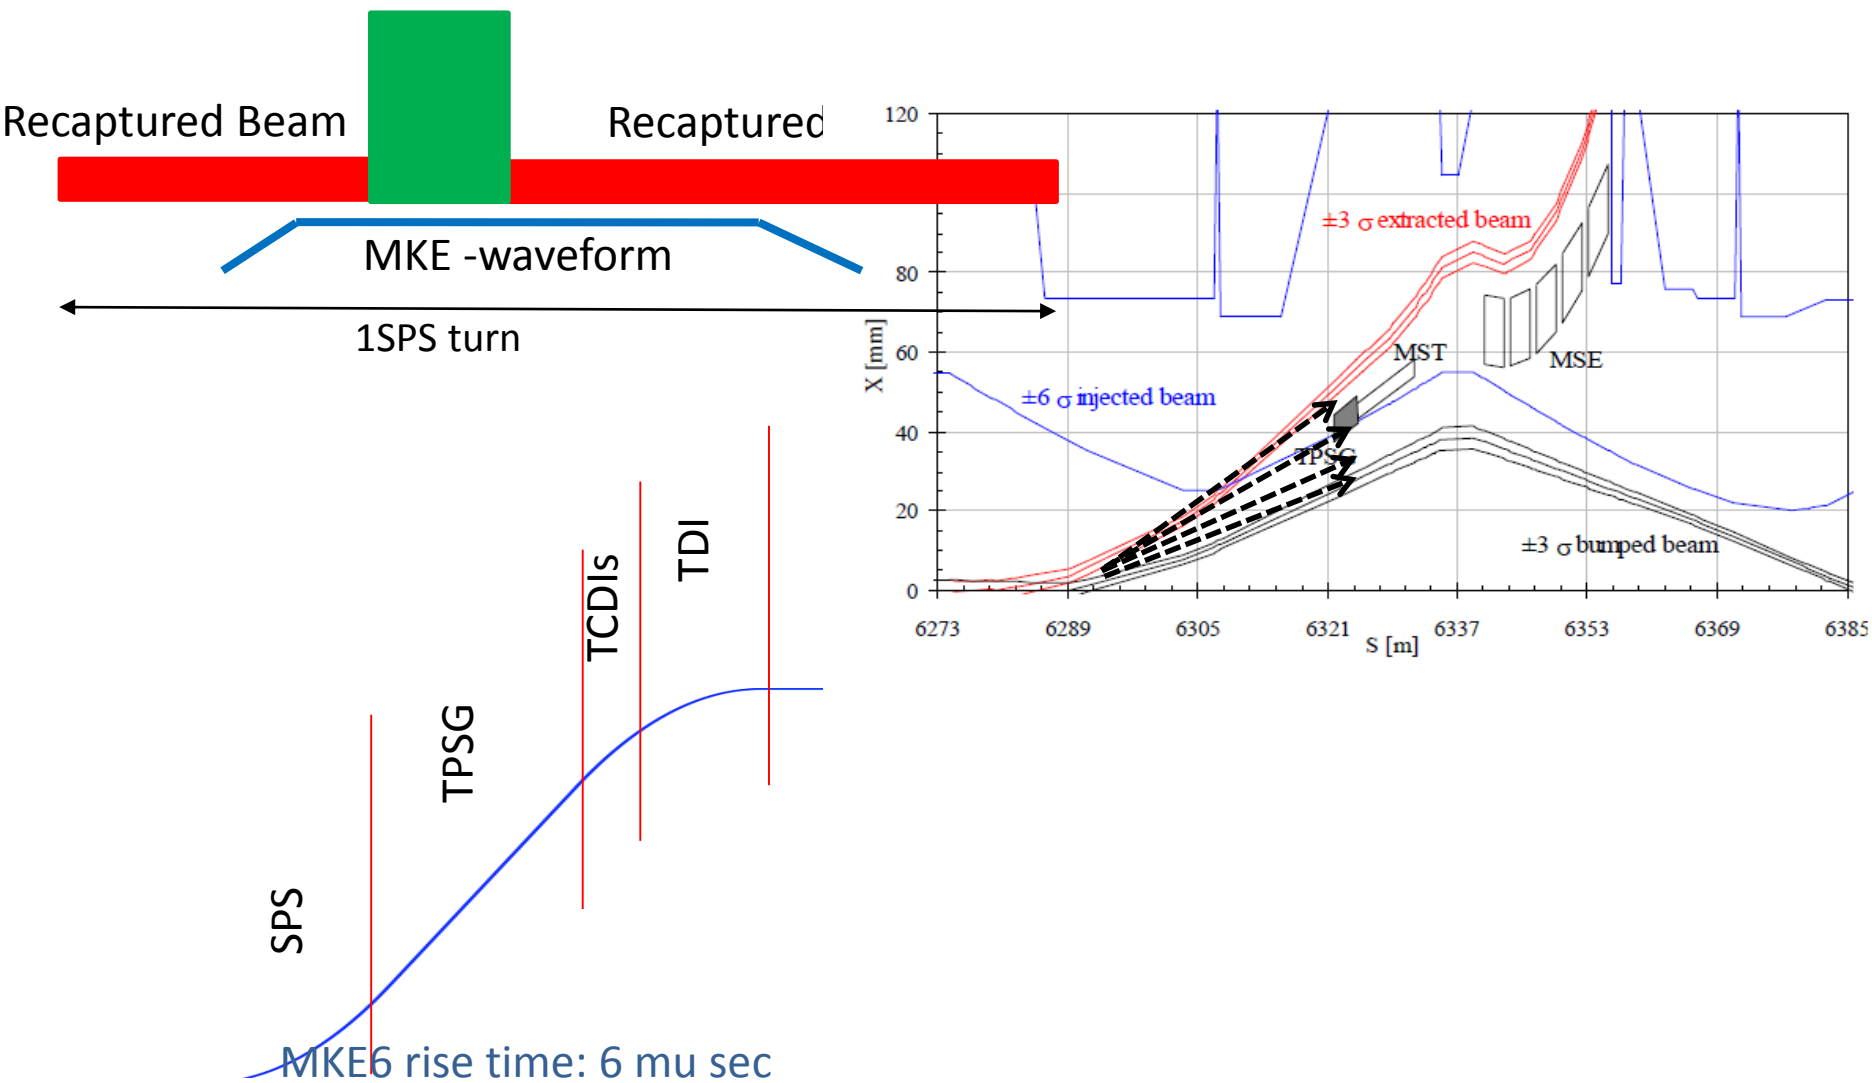

FESA class for oscilloscope systems.

Close collaboration with BE-BI-SW (Stephane Bart Pedersen)

New DAQ card will be developed by BI.

LSS6 extraction

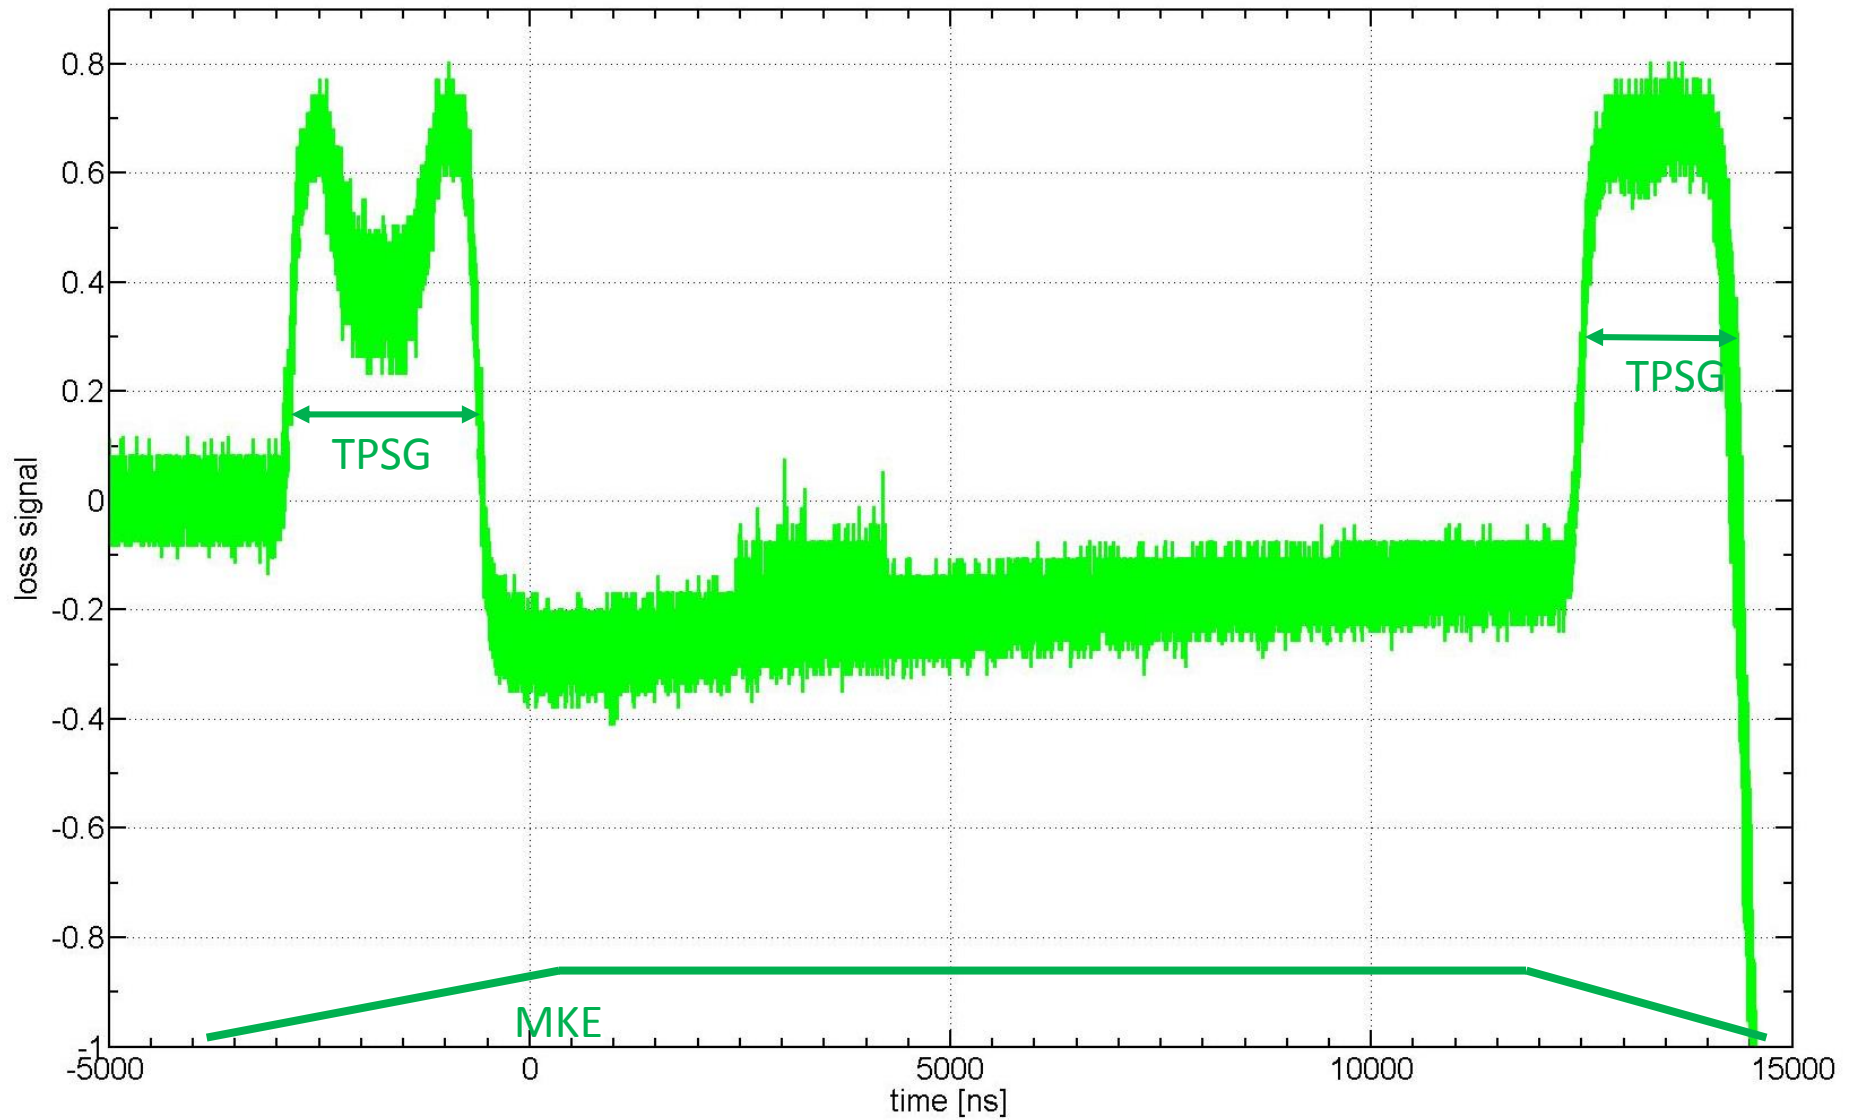

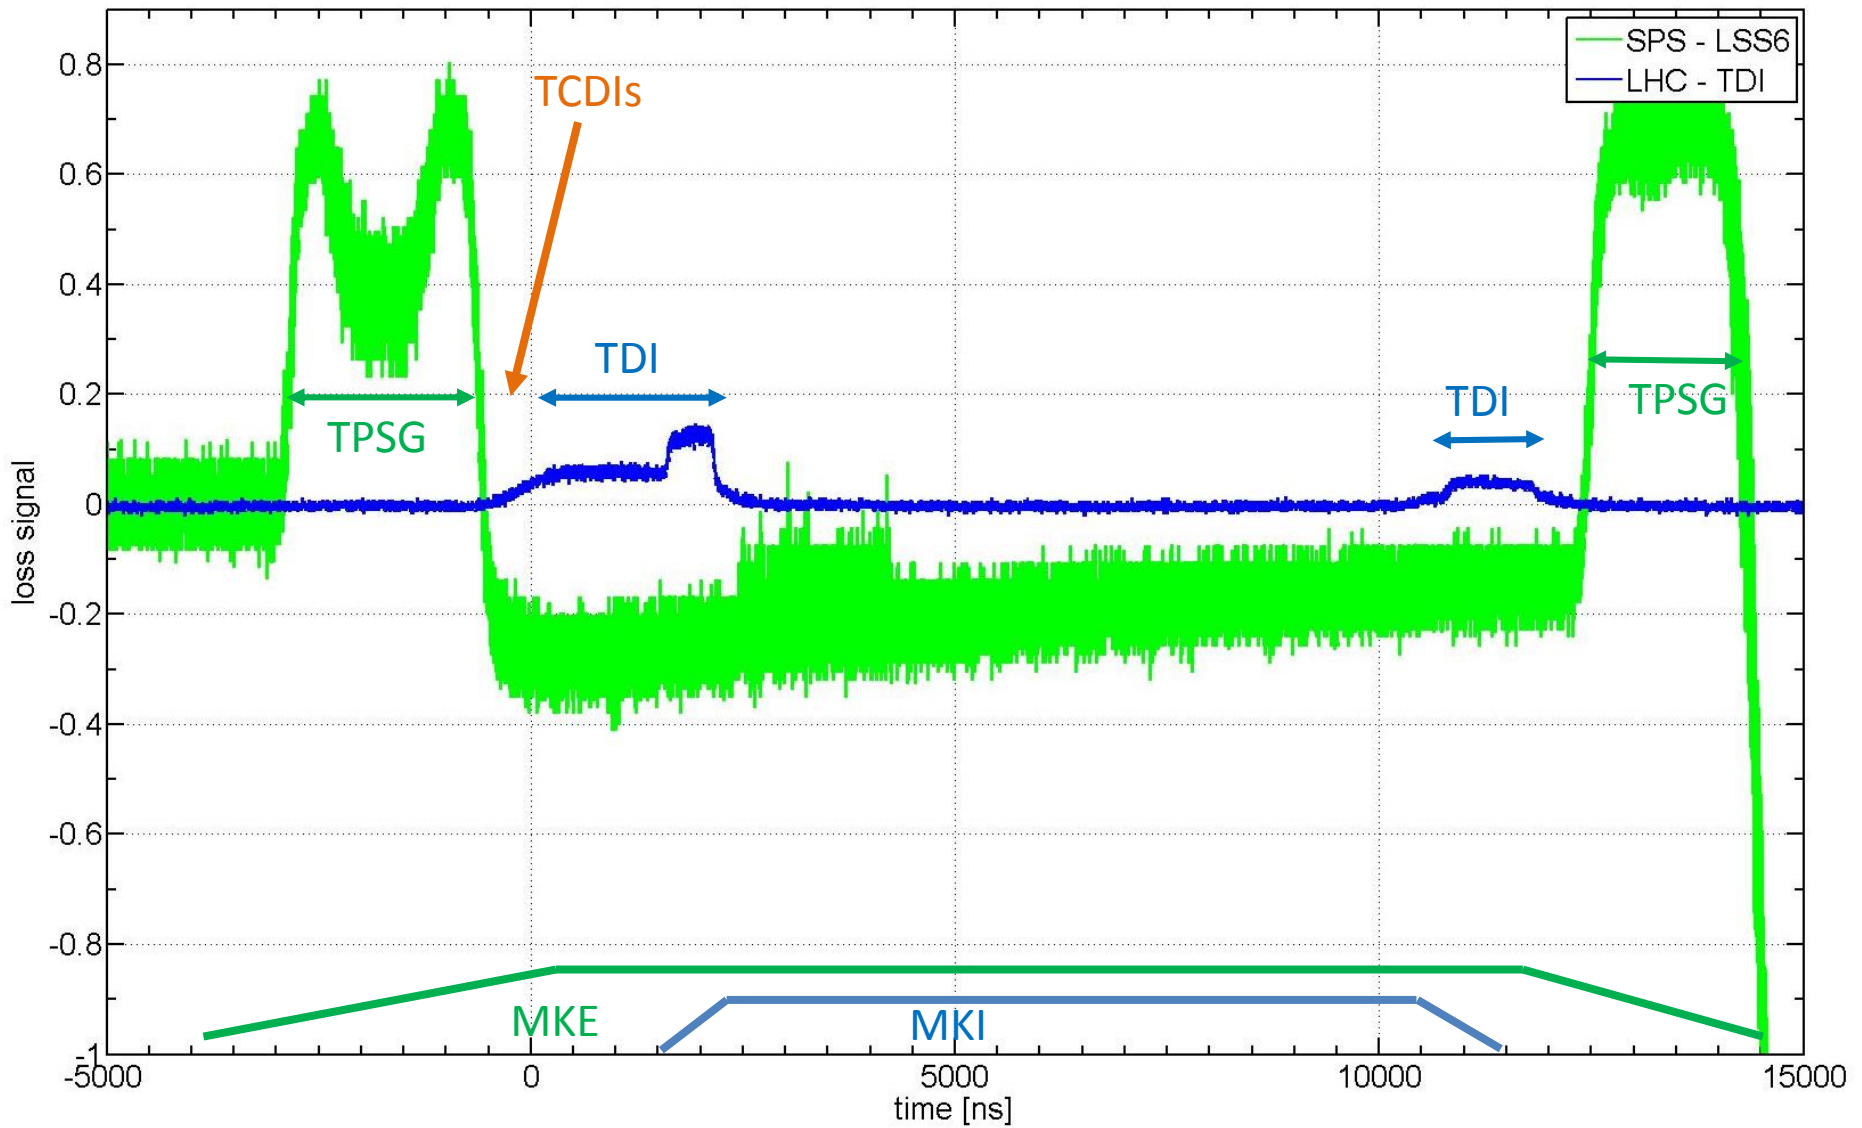

SPS losses – extraction LSS6 (B1)

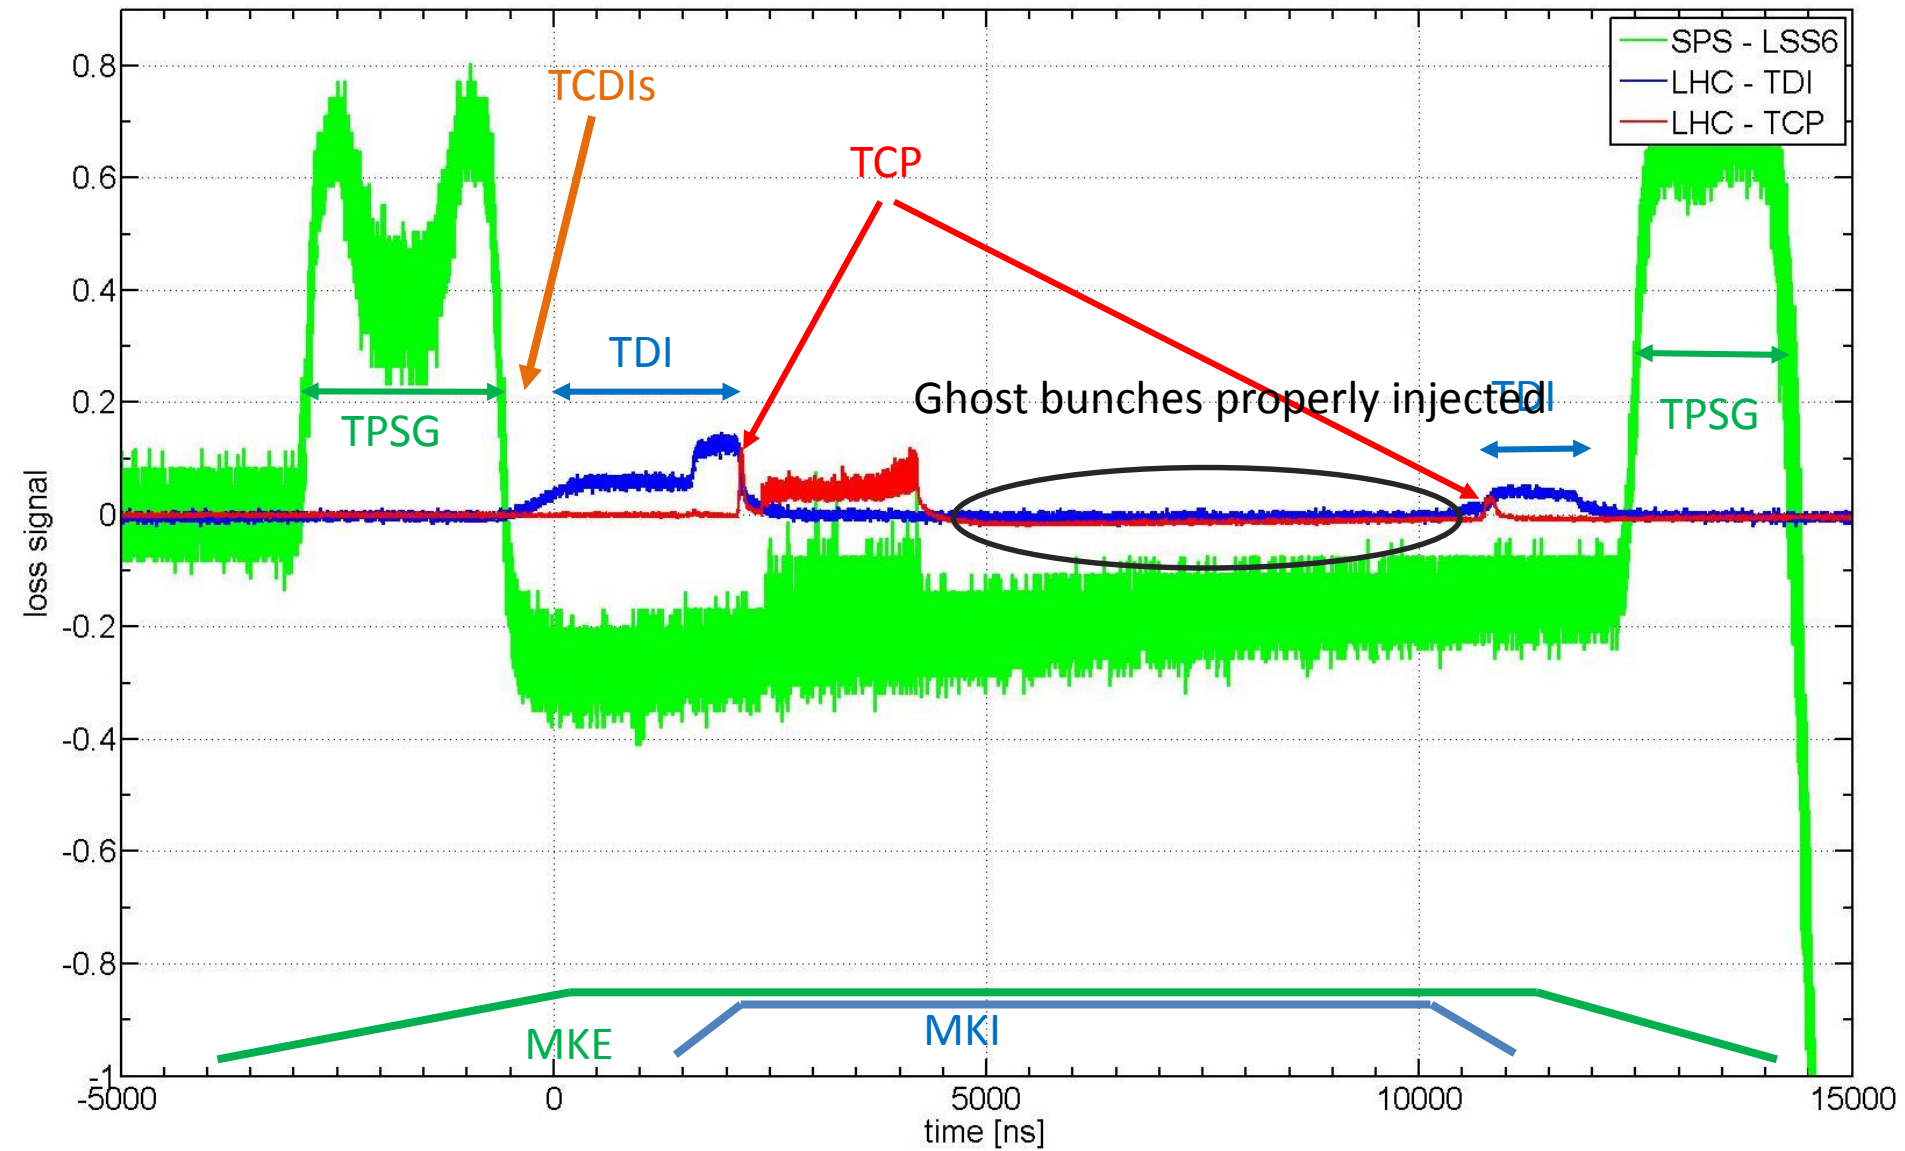

SPS losses - zoom

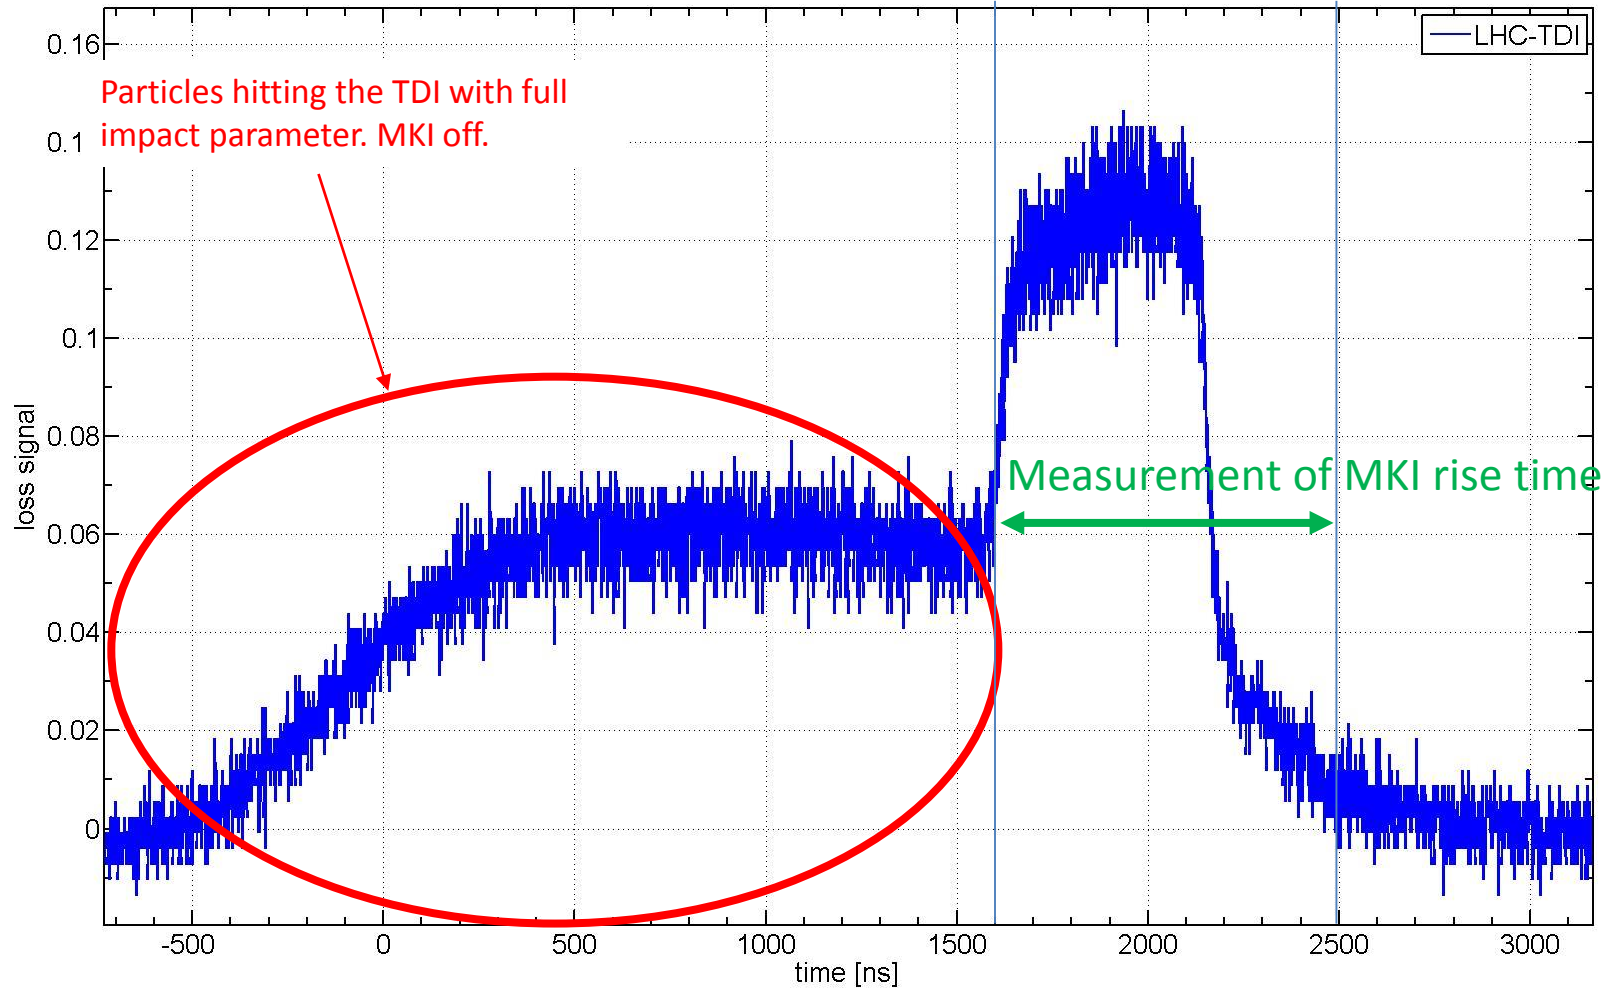

TDI losses

Last week...

NOW: 20.05.2016 – 3.10 am Beam 1

Losses at SPS extraction

MKE6 shorter rise time, shorter f.t., pulse length below 1 SPS turn, therefore also losses one SPS turn later.

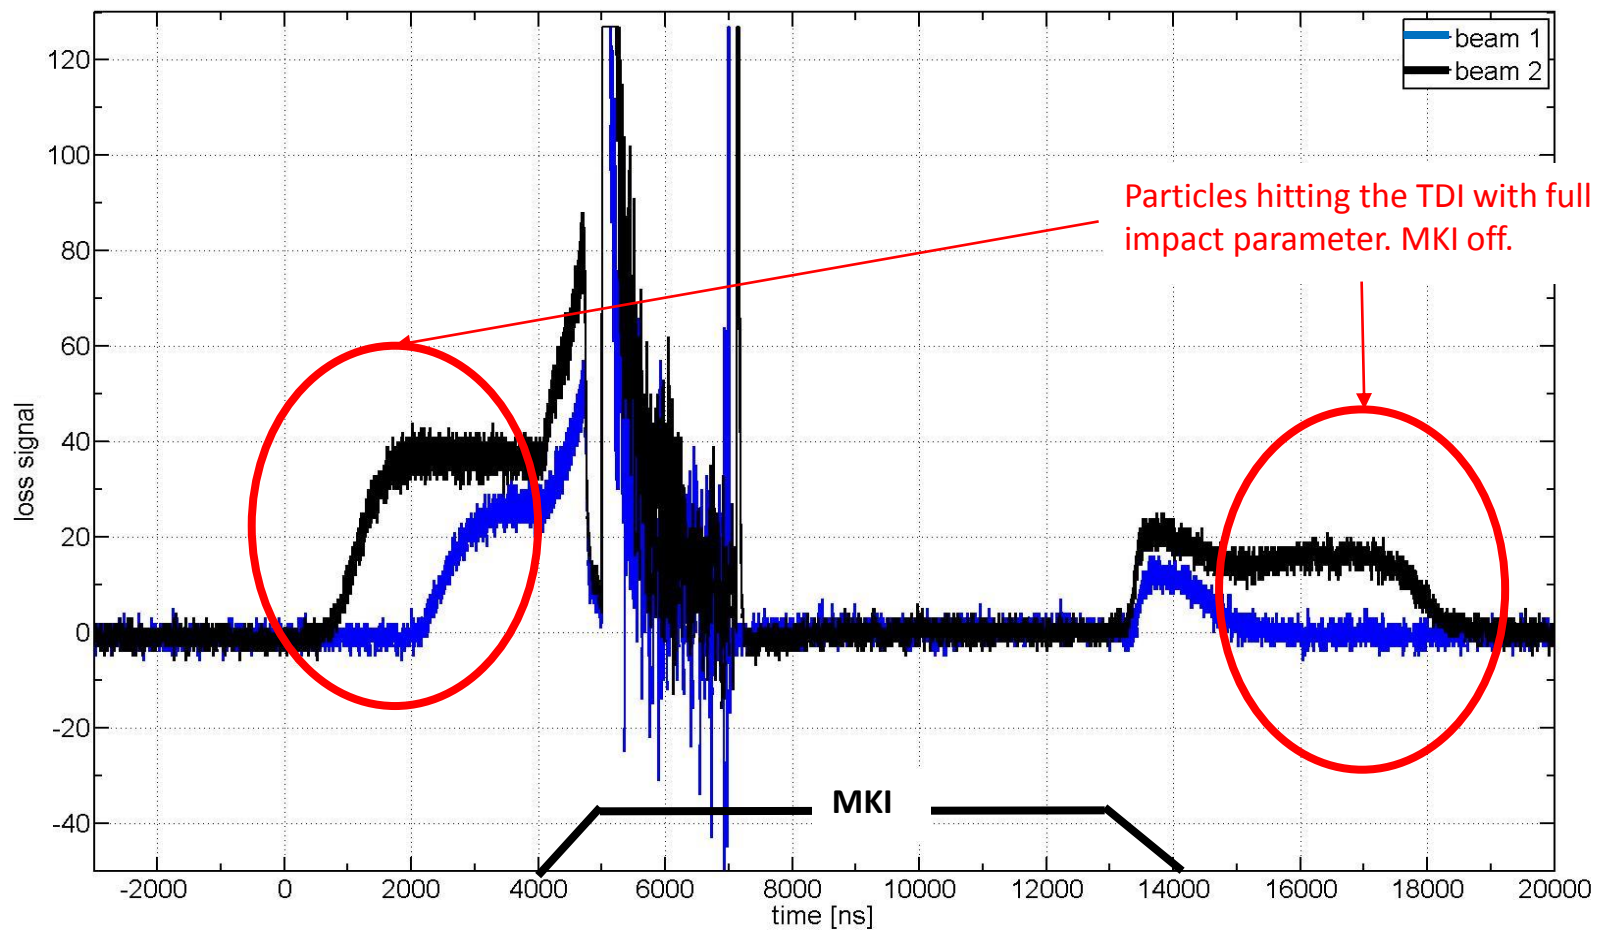

Higher losses on SPS side.

MKE4 pulse length longer than SPS turn. Ghost bunches properly extracted.

Higher losses on LHC side.

MKE Pulse measurements.

Losses at LHC injection (TDI)

Comparison empty kick and injection

Fresh data

Possible loss mitigation

- Situation should be better for 288b train injections.

Problems of last week:

- Improve beam quality from the injectors.

General options:

- Timing of injection gap cleaning?
- Clean around the batches with SPS MKQ tune kicker or transverse damper.
 - Successfully tested during a MD
 - Difficult to set-up.
 - Cleaner extractions – higher losses in the SPS.

Current status of DAQ

- DBLMs at LHC injection operational.
 - Optimization of FESA ongoing (triggering, resolution, file size, etc.)
 - Data in the PM...
 - Meeting with BE-OP and BE-BI to bring the data to IQC. Requirements to be defined.

Conclusion

- High longitudinal losses due to **re-captured beam** / ghost bunches coming from SPS.
- Measured with **dBLMs** installed close to the TDIs in IP2 and IP8 and at SPS extraction.
- **Origin of losses to be studied. PS? SPS?**
- Possible loss mitigations proposed.
 - LHC Injection gap cleaning
 - SPS MKQ/ADT cleaning
- **dBLMs operational**, DAQ and FESA to be finally optimized.
- Implementation to IQC – first meeting next week.
- **Loss behavior to be followed-up during intensity ramp-up.**

Thank you for your attention!
