

EFFICIENCY ANALYSIS OF B-PHYSICS HLT

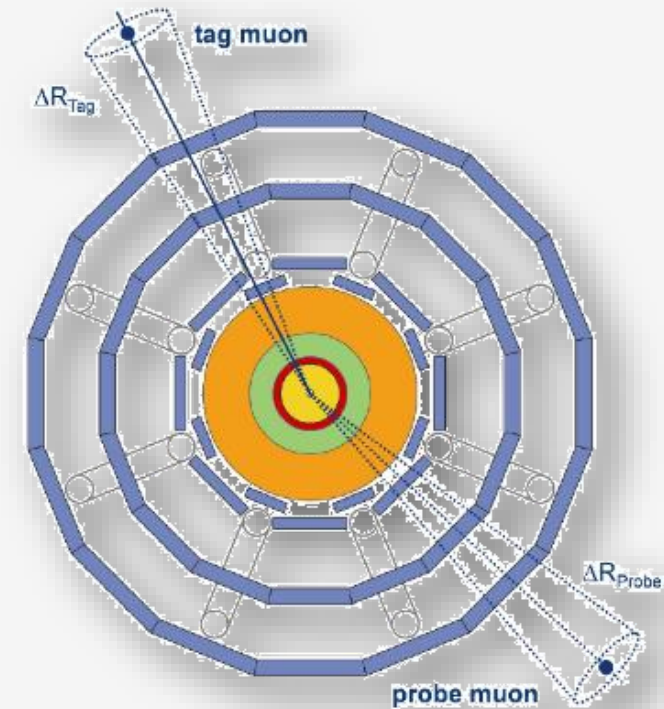

UM-REU UPDATE: 6/29/16

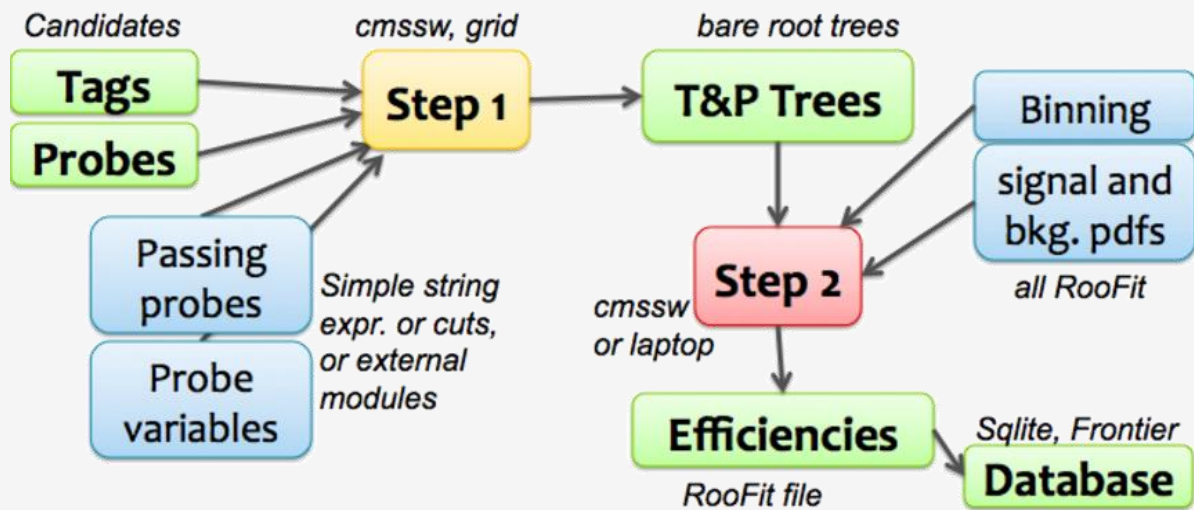

Sam Coday

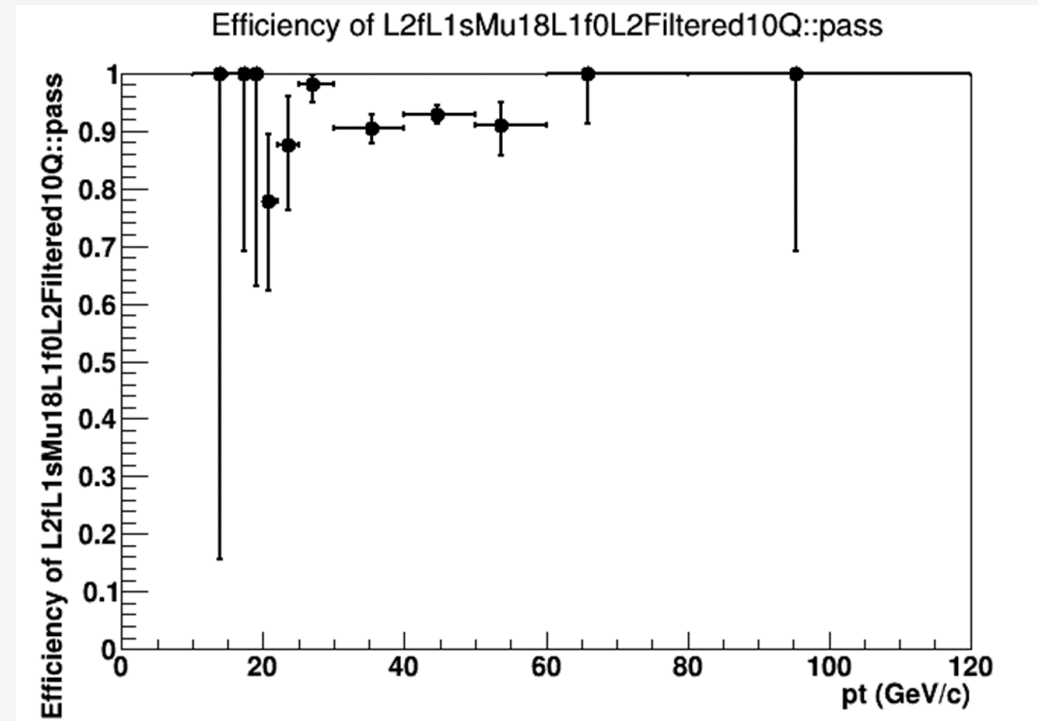

Tag and Probe

- Utilizes di-object resonances (Specifically J/psi)
- Tag and Probe Steps
 - Define “passing probes”
 - Passing and failing tag are modelled separately (background noise + signal)
 - Efficiency is defined by ratio between signals
 - Process is repeated for different bins (p_T, η)

Tag and Probe Workflow

Efficiency Plot (Z Boson)
(Plot taken from lower energy runs)

Why does this matter?

- Culmination of Error (L1+L2)
- Comparison to MC
- Baseline for next HLT iteration

Summer Goals

- Understand the complexity of working in large scale collaborations
 - Gain experience in code collaboration
 - Be challenged by advisors and peers
-
