

# PHENIX results on three particle Bose-Einstein correlations in $\sqrt{s_{\text{NN}}} = 200 \text{ GeV Au+Au collisions}$

*Wednesday 14 June 2017 14:00 (20 minutes)*

Bose-Einstein correlations of identical hadrons reveal information about hadron creation from the sQGP formed in ultrarelativistic heavy ion collisions. The measurement of three particle correlations may in particular shed light on hadron creation mechanisms beyond thermal/chaotic emission. In this talk we show the status of PHENIX measurements of three pion correlations as a function of momentum differences within the triplets. We will analyze their shape through the assumption of Levy sources and a proper treatment of the Coulomb interaction within the triplets. We plan to determine Levy parameters scale ( $R$ ), shape ( $\alpha$ ) and three particle correlation strength ( $\lambda_3$ ), where the latter, together with two particle correlation strength  $\lambda_2$ , encodes information about hadron creation mechanisms. From a consistent analysis of two- and three-particle correlation strength we may be able to establish an experimental measure of thermalization and coherence in the source.
