

Transverse momentum fluctuations and correlations

Friday, June 16, 2017 9:00 AM (30 minutes)

We study the fluctuations and correlations of the average transverse momentum of particles emitted in heavy-ion collisions. The momentum fluctuations are related to event-by-event fluctuations of the size and entropy of the initial source. Hydrodynamic calculations using a Glauber model with quark degrees of freedom reproduce the data. We study correlation of the average transverse momentum in different rapidity bins. We propose a definition of the observable that can be directly related to correlations of the collective flow variables. The correlation as function of rapidity separation can serve to pin down possible sources of momentum fluctuations in the initial state and the dynamics.

List of tracks

Fluctuation in initial conditions, collective flow and correlations

Primary authors: BOZEK, Piotr (AGH University of Science and Technology); BRONIOWSKI, Wojciech (IFJ PAN); CHATTERJEE, Sandeep (AGH University of Science and Technology, Krakow)

Presenter: BOZEK, Piotr (AGH University of Science and Technology)

Session Classification: Fluctuation in initial conditions, collective flow and correlations
