

A Fresh Approach to Technical Computing

Stefan Karpinski

Numerical languages

What's the deal with these?

specialized for numerical work

Matlab

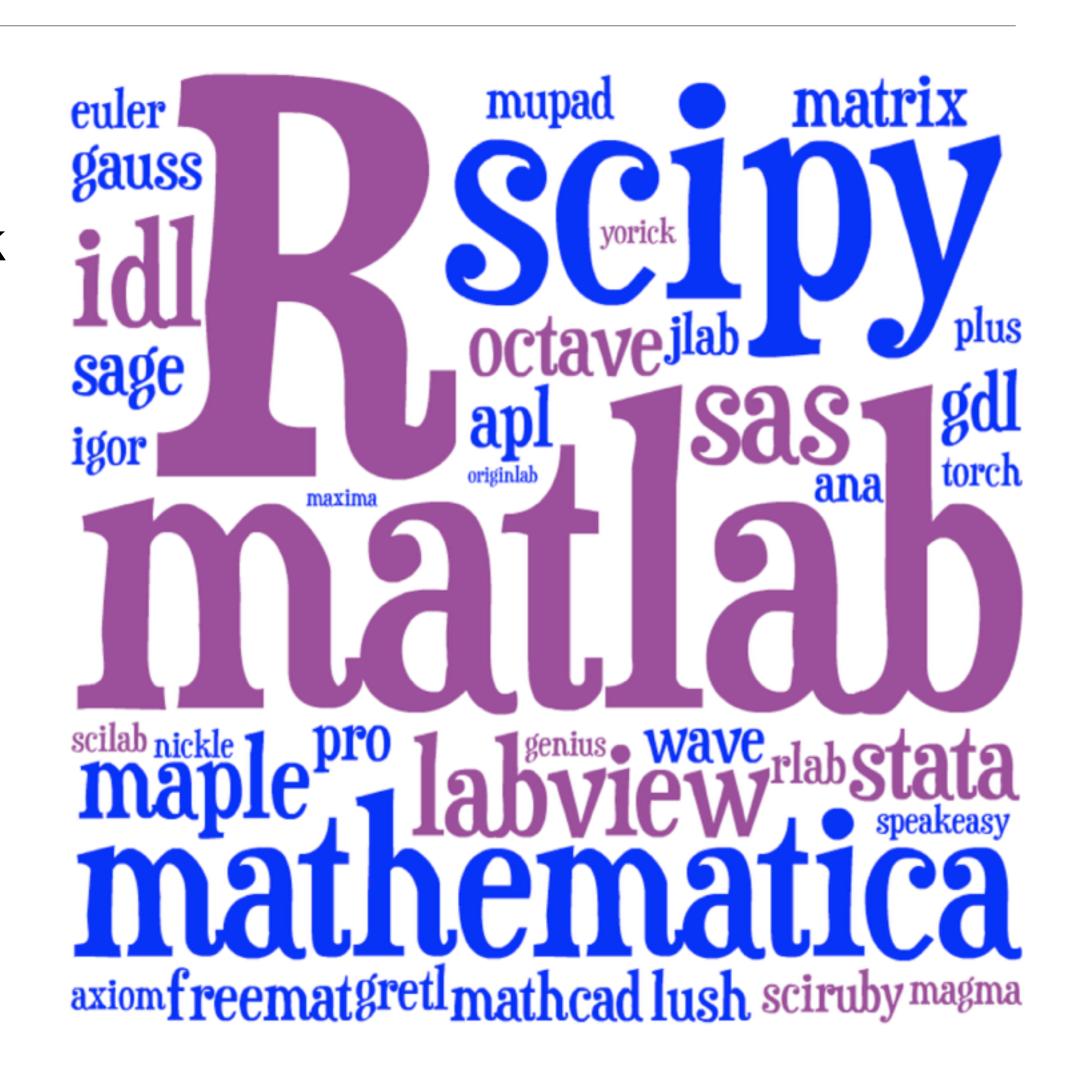

everything is a <u>complex matrix</u>

R (and S before it)

- ► allow "NA" values everywhere
- data frame as basic data type

Mathematica

symbolic rewriting everywhere

R⁶RS spec:

- ▶ 20% numerical
- ► (C99 is similar)

CONTENTS	7.1 Library form	23
Introduction	3 7.2 Import and export levels	25
Description of the language	7.3 Examples	26
1 Overview of Scheme	8 Top-level programs	27
	5 8.1 Top-level program syntax	27
	0.2 Top lever program bemanues	28
*	6 9 Primitive syntax	28
3	or remitted dispression types	28
	6 9.2 Macros	29
1.5 Forms	7 10 Expansion process	29
1.6 Procedures	7 11 Base library	31
1.7 Procedure calls and syntactic keywords	7 11.1 Base types	31
1.8 Assignment	7 11.2 Definitions	31
1.9 Derived forms and macros	8 11.3 Bodies	32
1.10 Syntactic data and datum values	8 11.4 Expressions	32
1.11 Continuations	8 11.5 Equivalence predicates	37
1.12 Libraries	9 11.6 Procedure predicate	39
1 12 Top level programs	0 11.7 Anithmetic	20
1.13 Top-level programs	9 11.7 Arithmetic	39 47
2 Requirement levels	9 11.8 Booleans	47
2 Requirement levels	9 11.8 Booleans	47 47
2 Requirement levels	9 11.8 Booleans	47 47 49

Are we doing it wrong?

Numerical languages are strangely diverse

General languages are strangely numerical

This doesn't seem quite right.

Julia: a new approach

Stop making numbers special

All numeric types are user-defined

(Some of them are just defined for you)

The challenge

What does it take

to make numbers just another type

and still do real numerical work?

Numeric operations

Operations like +, *, [], \

- unusually polymorphic often not normal functions
- behavior depends on all arguments not just first
- ▶ extensibility to new numeric types ⇔ the expression problem

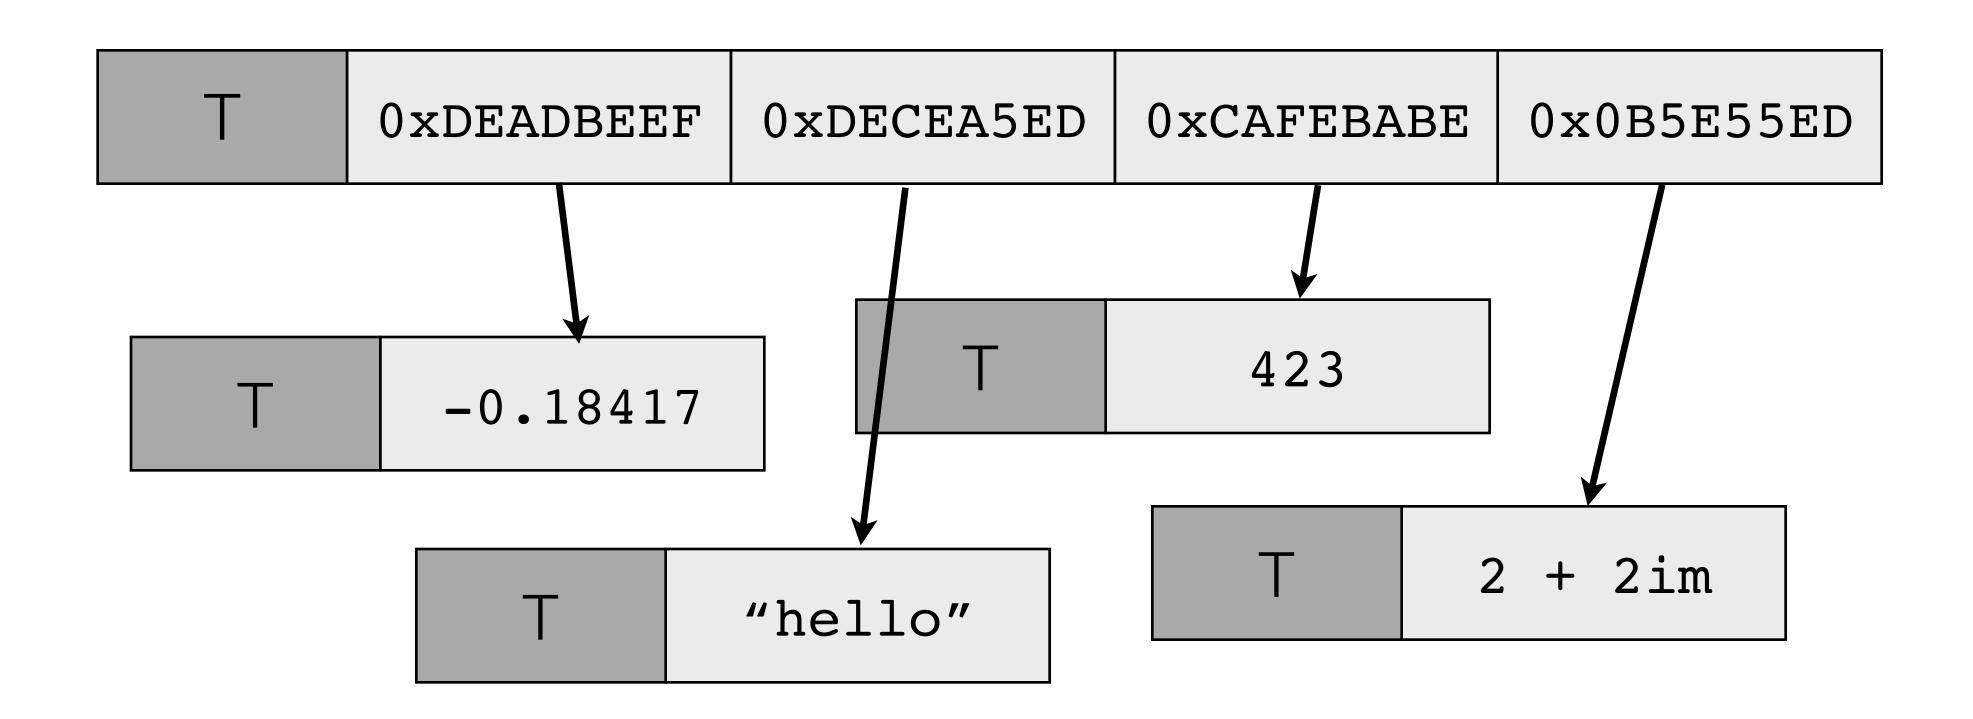

We need multiple dispatch

- but if ops like Int+Int and Float64*Float64 are generic
- generic functions had better be blazingly fast (basically free)

Arrays

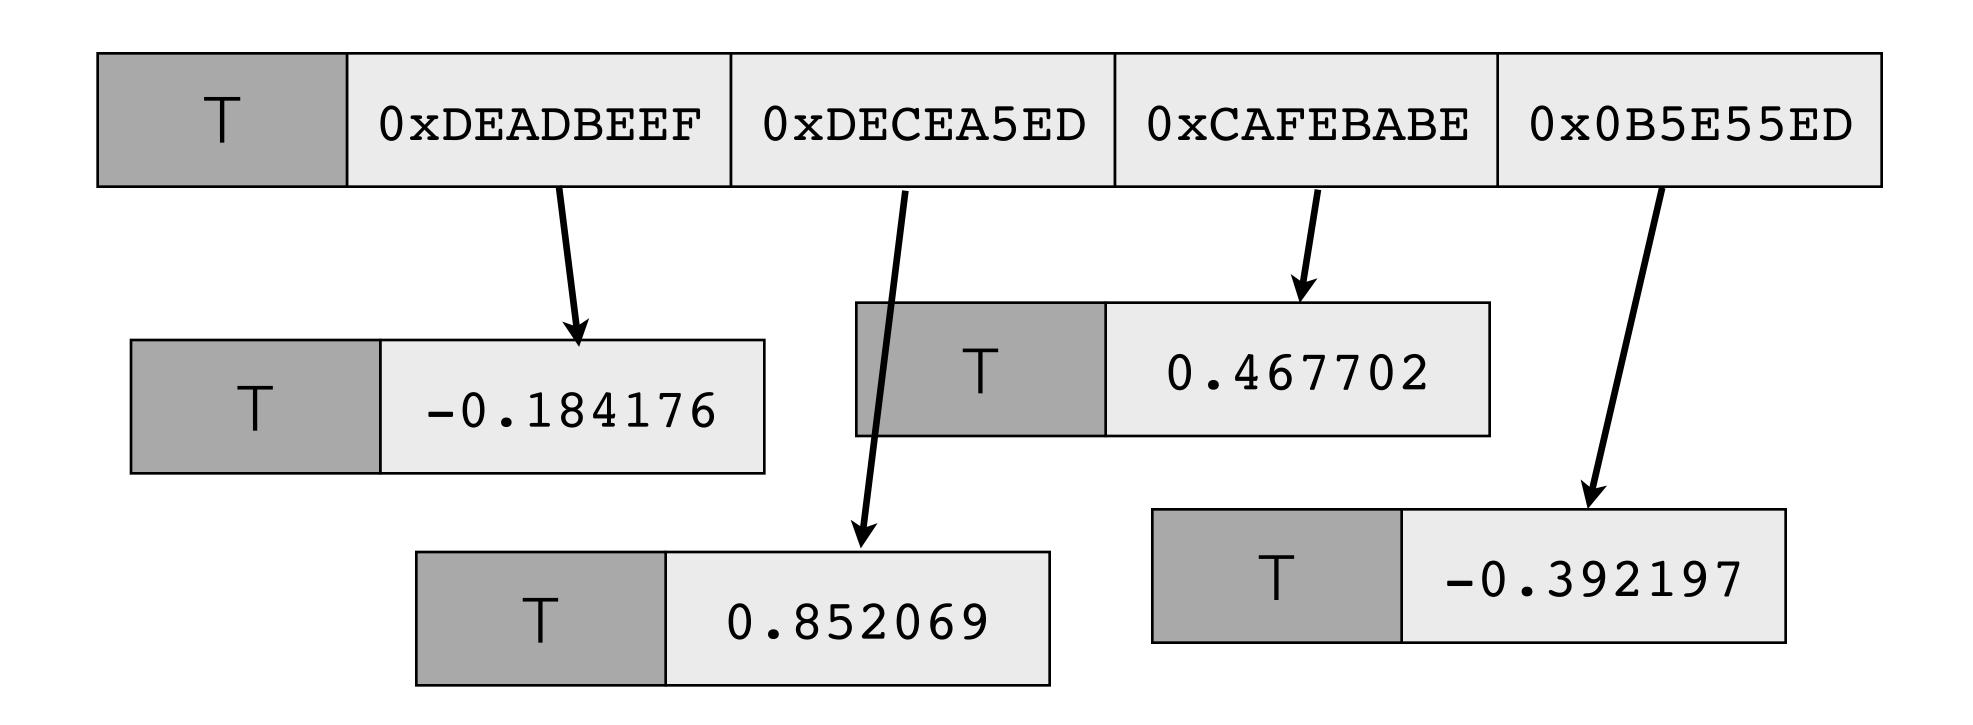

[-0.18417, "hello", 423, 2 + 2im]

Arrays

Any[-0.18417, 0.85206, 0.46770, -0.39219]

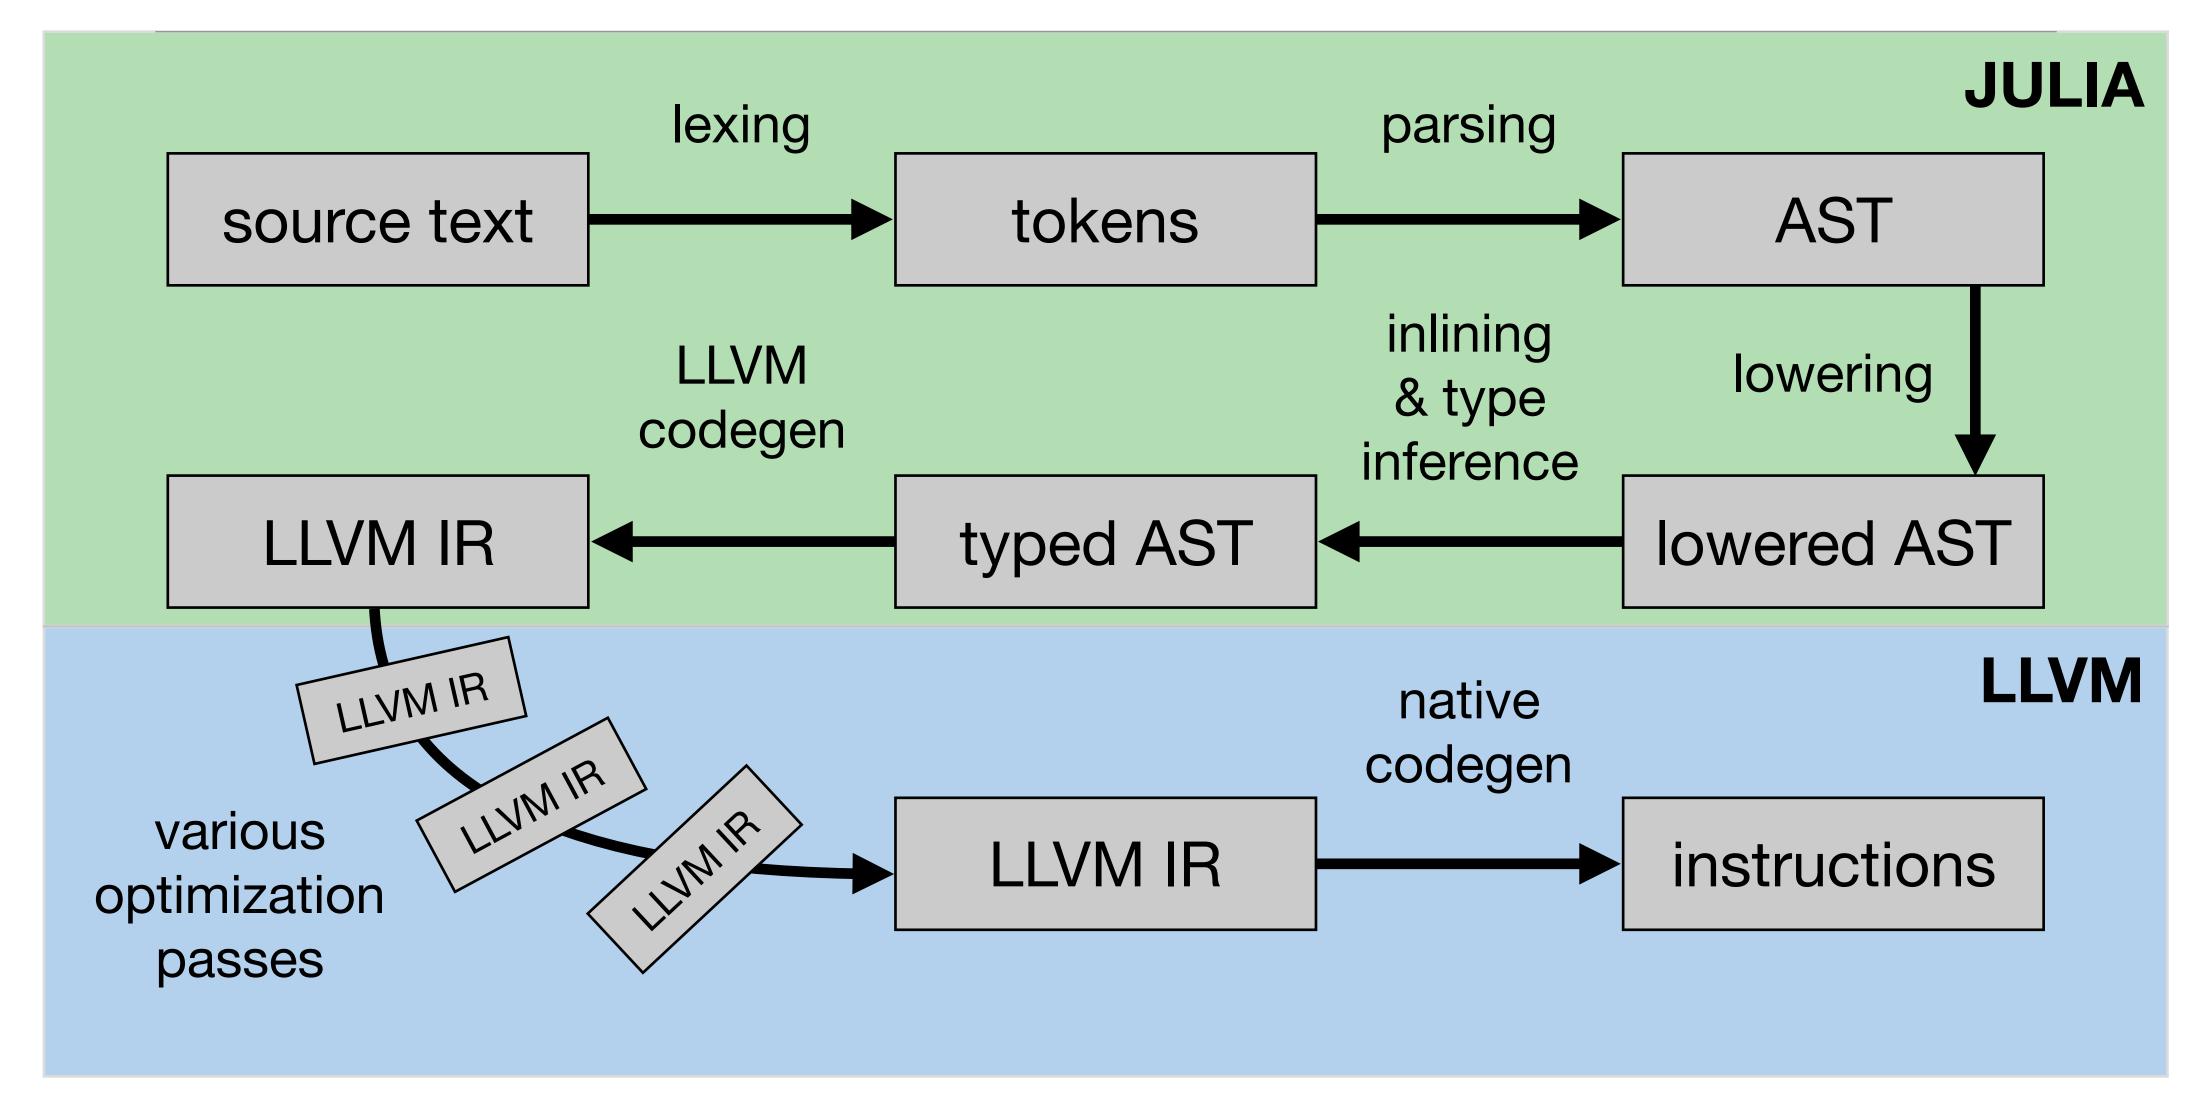

Staged programming

Allowing the programmer to generate code at various points in the compilation process

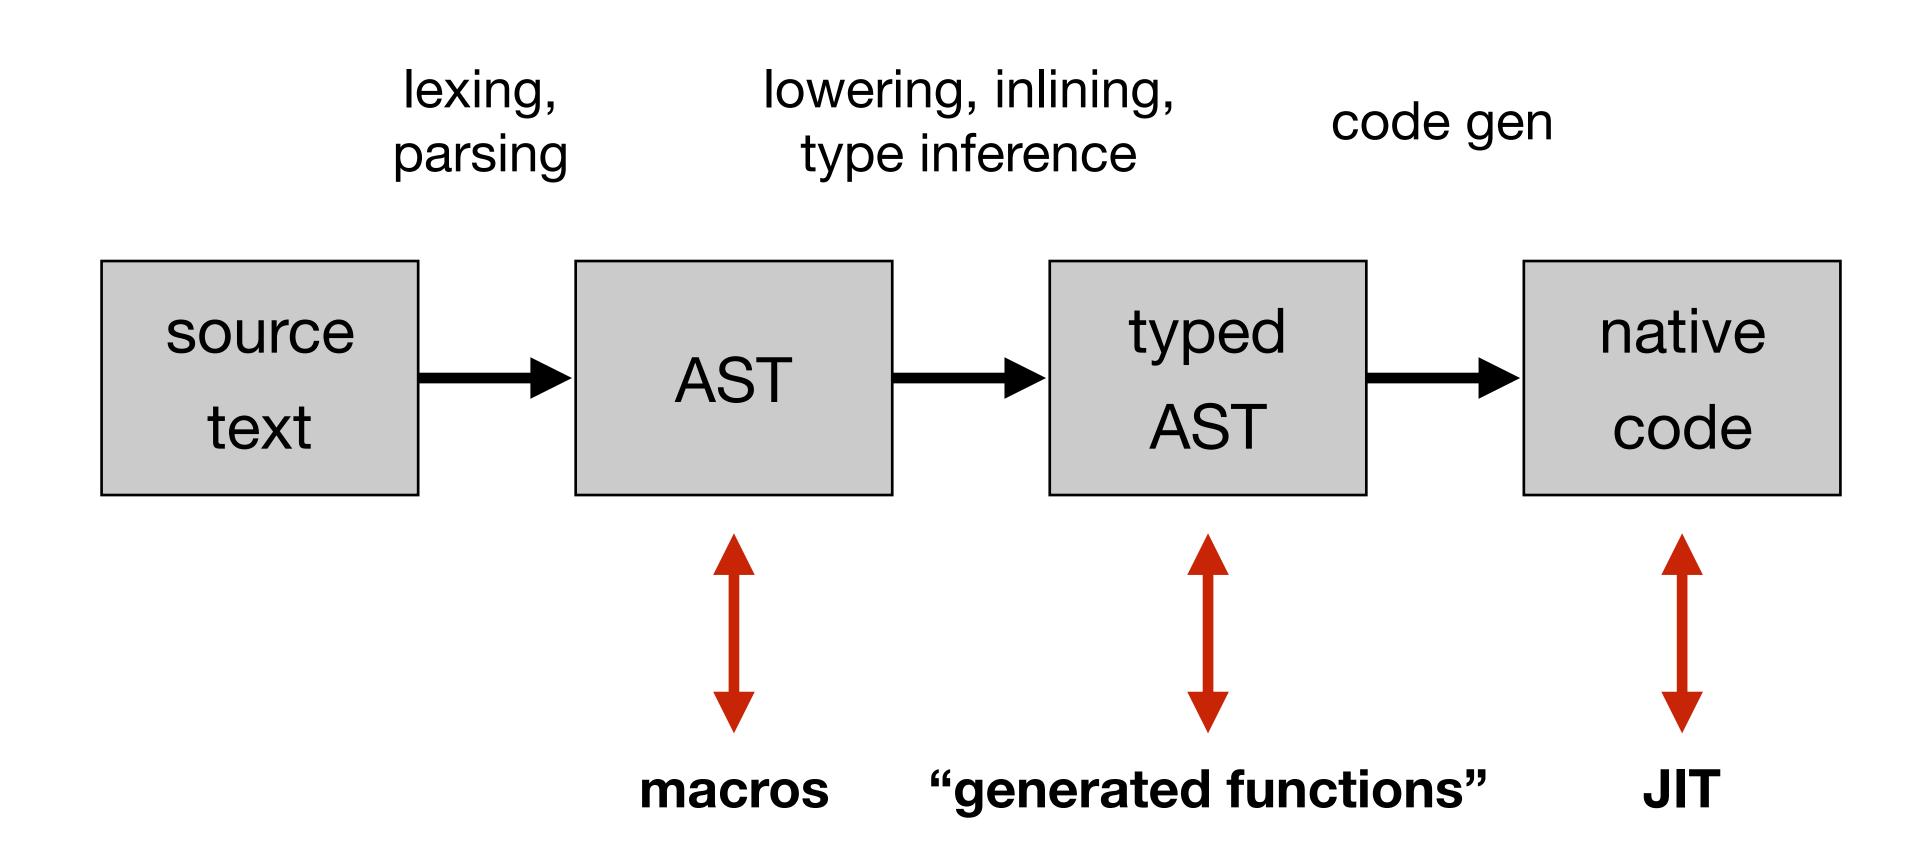

From Source to Machine Code

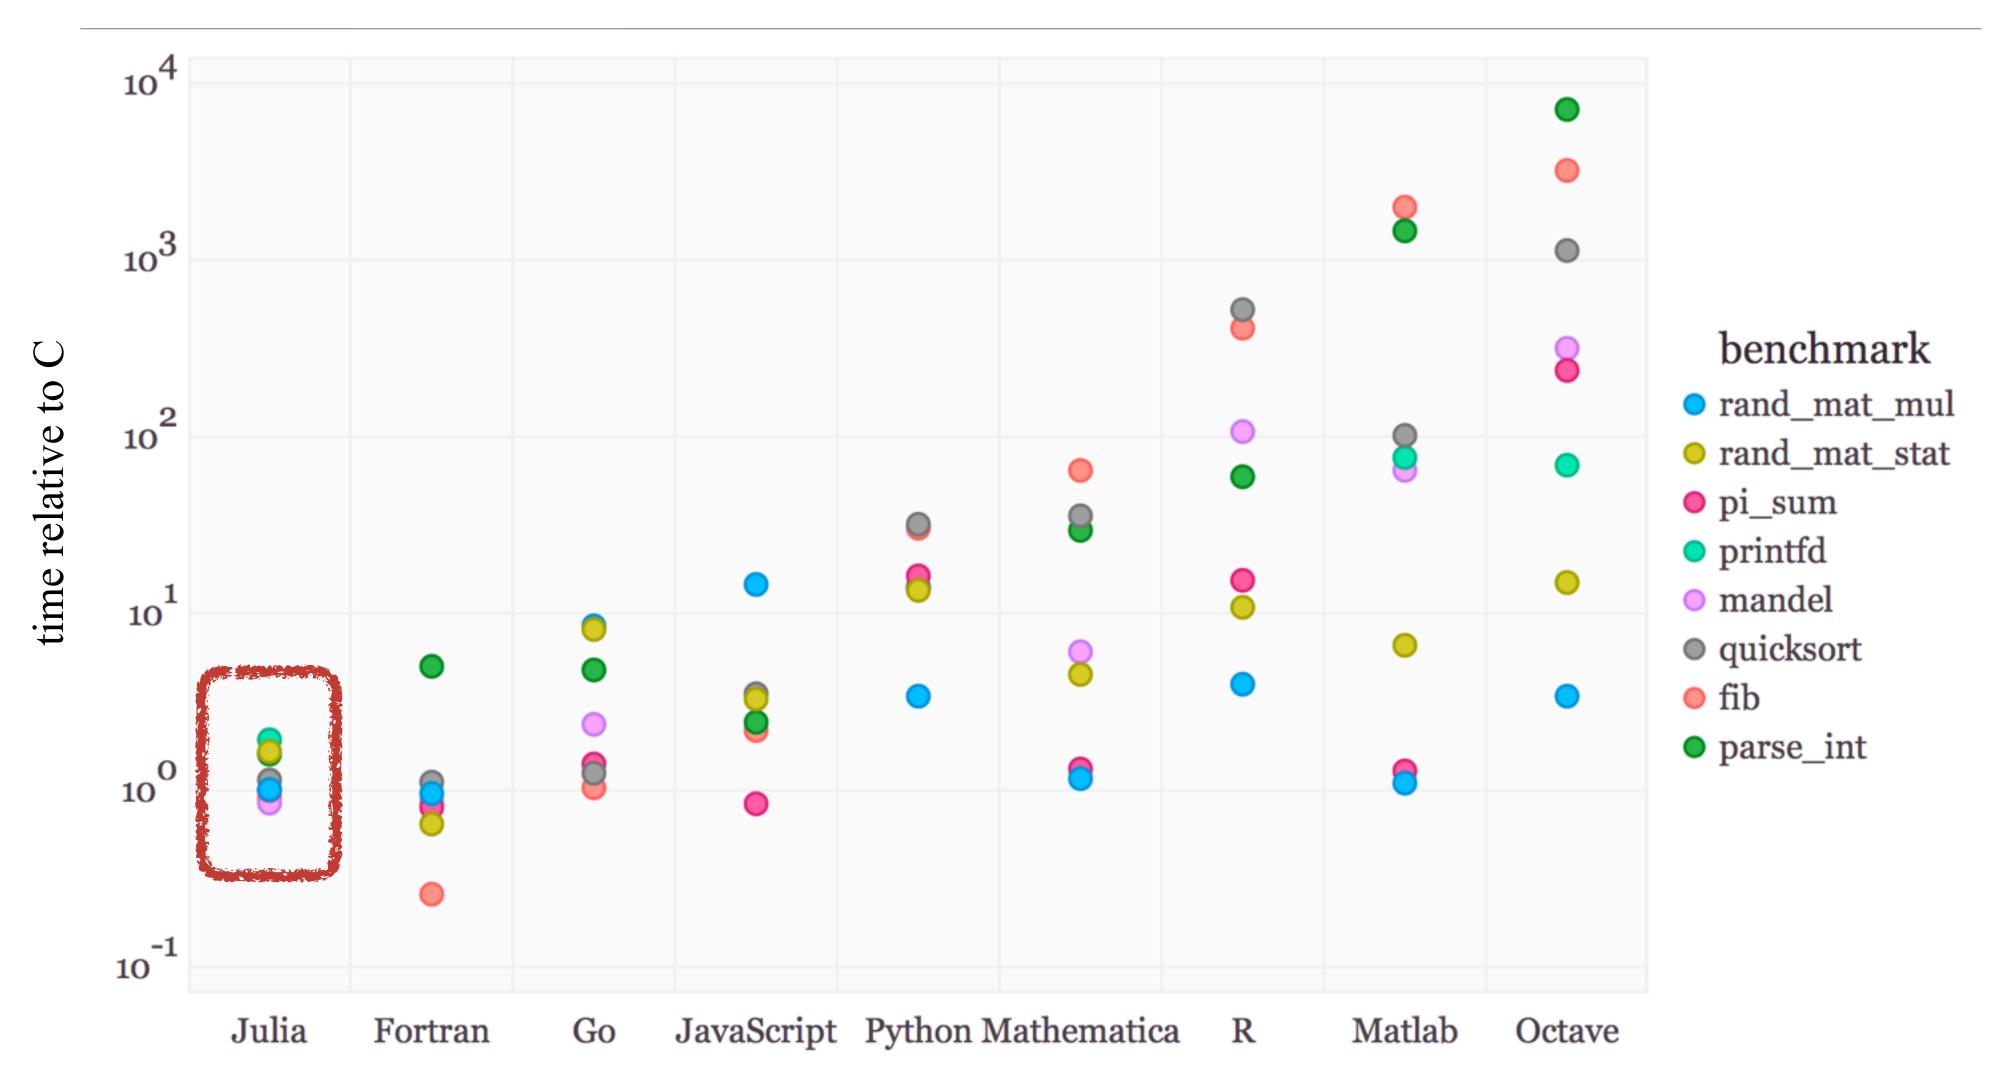

Hooking into compilation

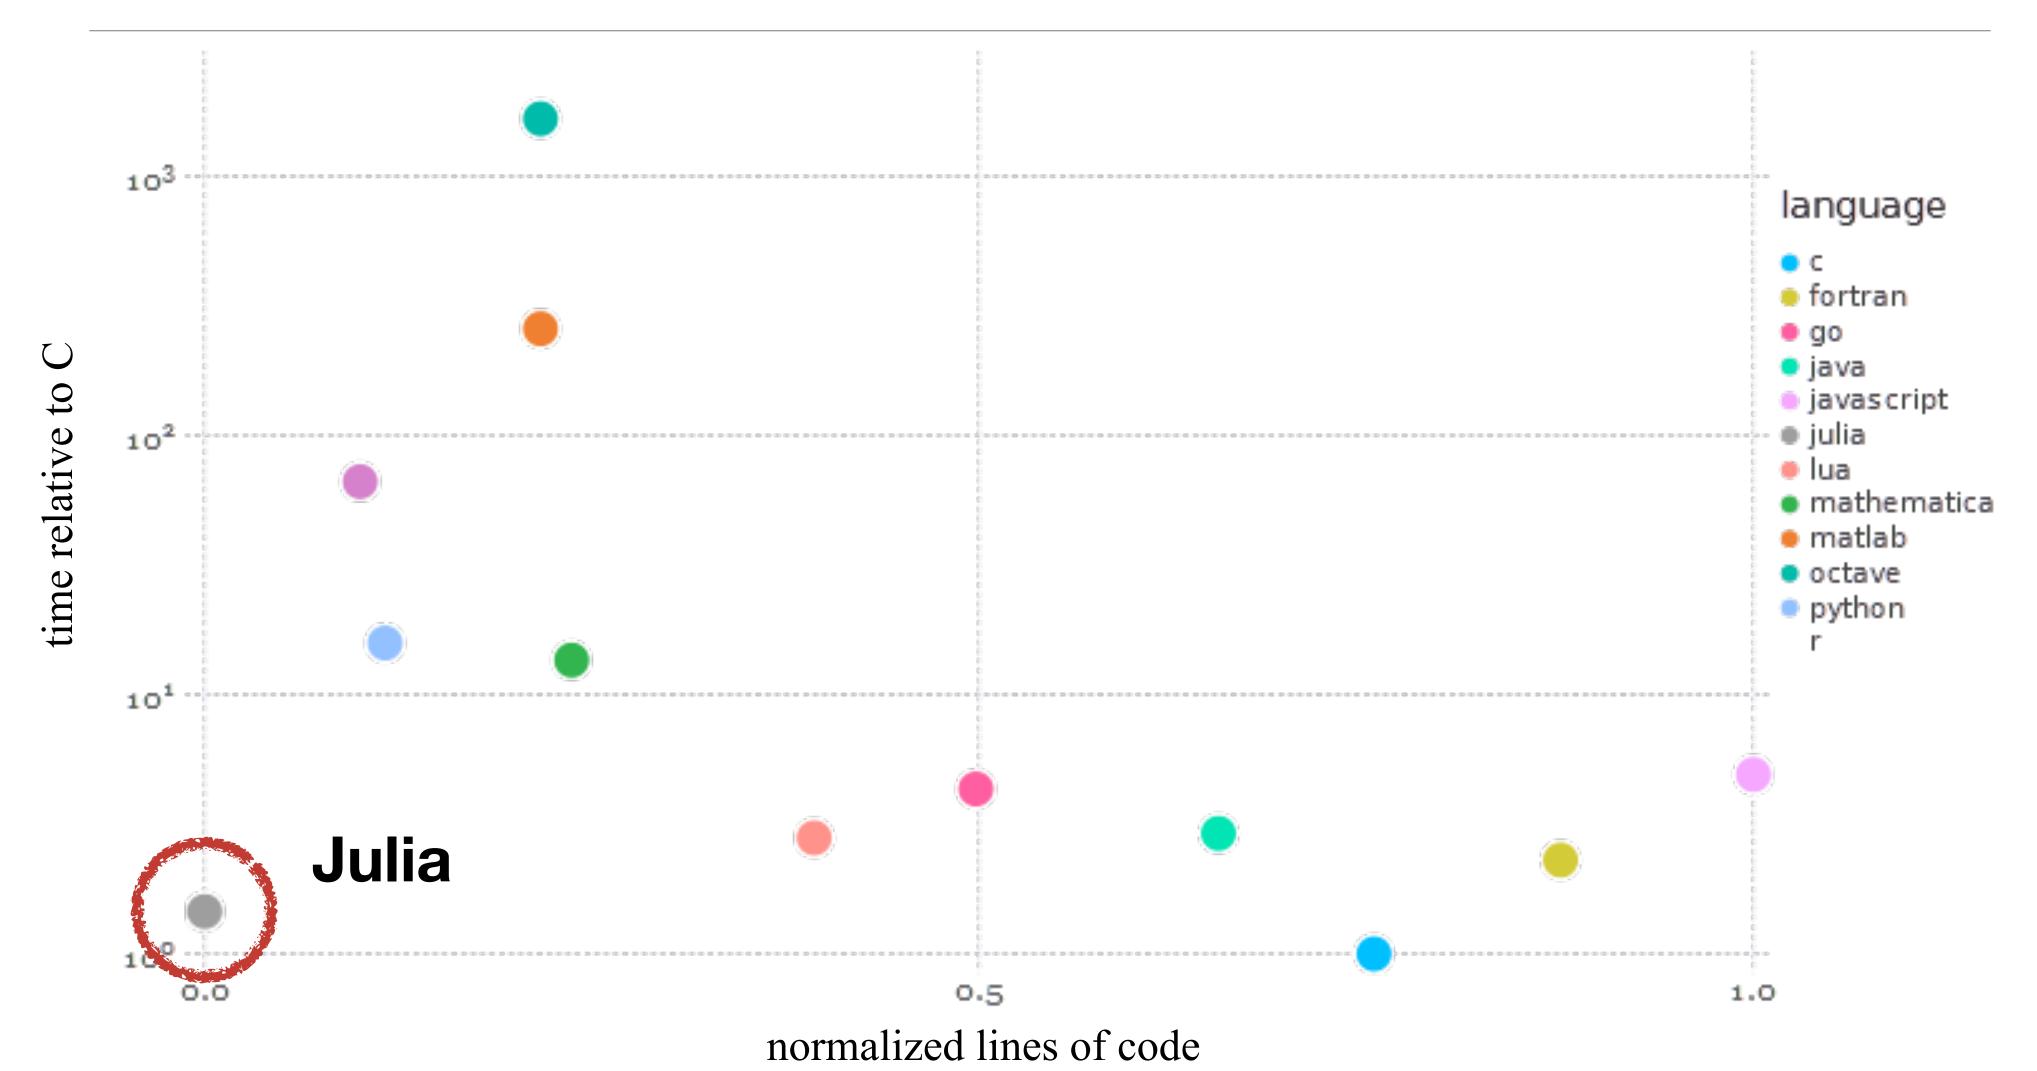

Speed

Speed vs. Productivity

Demos & Examples

- ► Simple generic programming: nextfib
- ▶ Interactive visualization: Julia set
- Efficient custom types: Kakuro
- Multiple dispatch: notebook, promotion system
- Macros & metaprogramming: Horner & evalpoly
- Generated functions: nloops, Savitsky-Golay smoothing
