GPM With Incomplete Event Data

Dump context	
Event timestamp:	2016.06.16 04:24:39 CEST
Fill number:	5021
Filling pattern:	
Acc / Beam mode:	PROTON PHYSICS / STABLE BEAMS
Energy:	6499440 MeV
Intensity B1:	18748 e^10 charges
Intensity B2:	19515 e^10 charges
SMP flags:	PRESENT, STABLE, MOVEABLE / PRESENT, STABLE, MOVEABLE
BSTAR 1/2/5/8:	0.4 / 10.03 / 0.4 / 3.0 m

Event sequen	
Event category:	TIMING_EVENT
Event classification:	PM1_EVENT
Event sequence:	No input change detected
Triggered BIC inputs:	
SCEvents:	No power converter events found

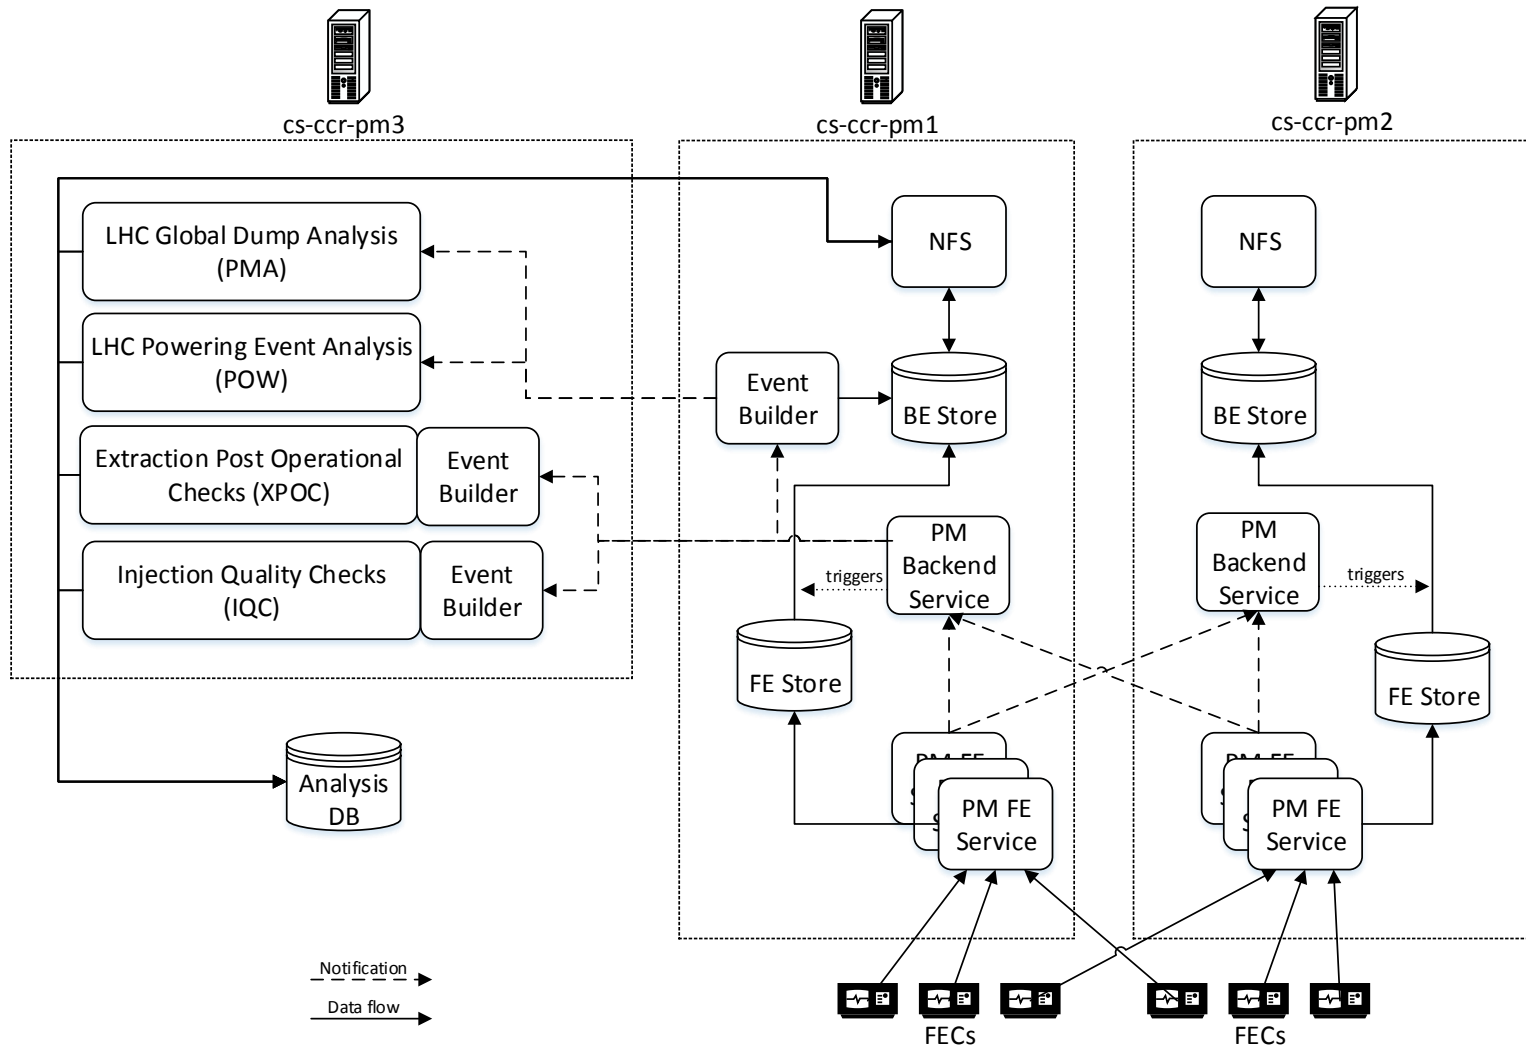

Machine protection features		
Event description	BIC_ES finished with warnings.	
Highest beam losses:		
Magnet quenches:	No magnet quenches found	
nQPS triggers:	No nQPS events found	
BIC IPOC:	✘	FMCM ISA: ✔
XPOC B1:	✘	PIC IPOC: ✔
XPOC B2:	✘	
Safe for injection ?	✘	PM Overall: ✘

PM System Architecture

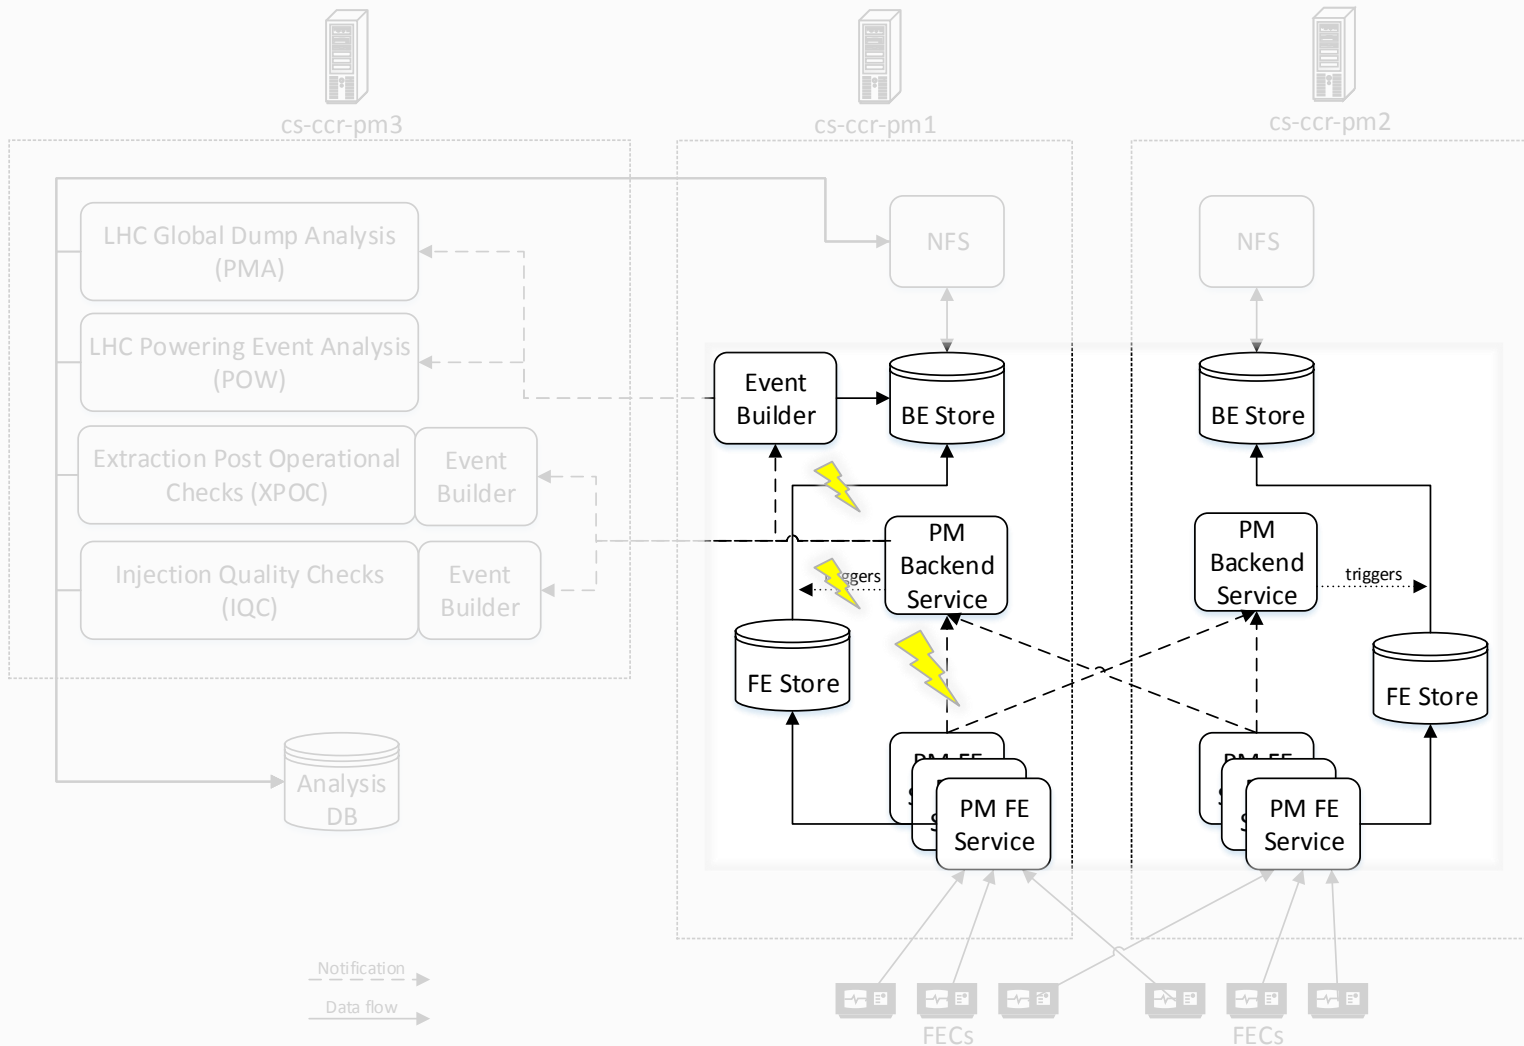

Problem

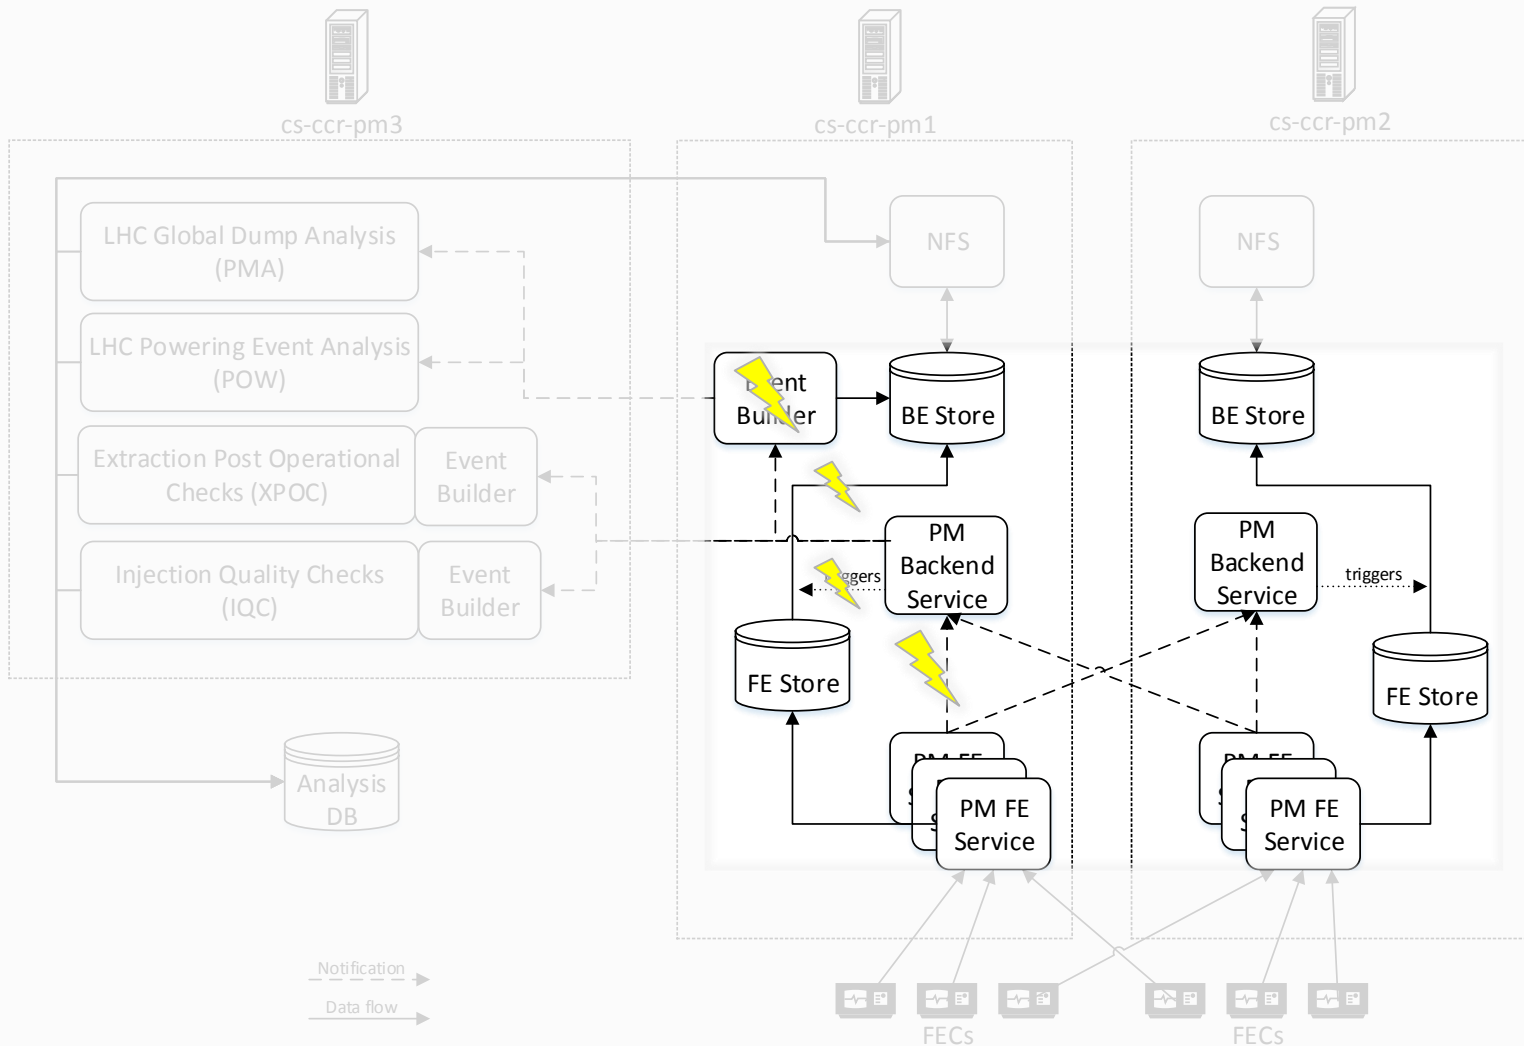

Problem

Problem

Problem

Timeline Of Problem Occurrence

Incomplete Event Data
FE-BE Connection Loss

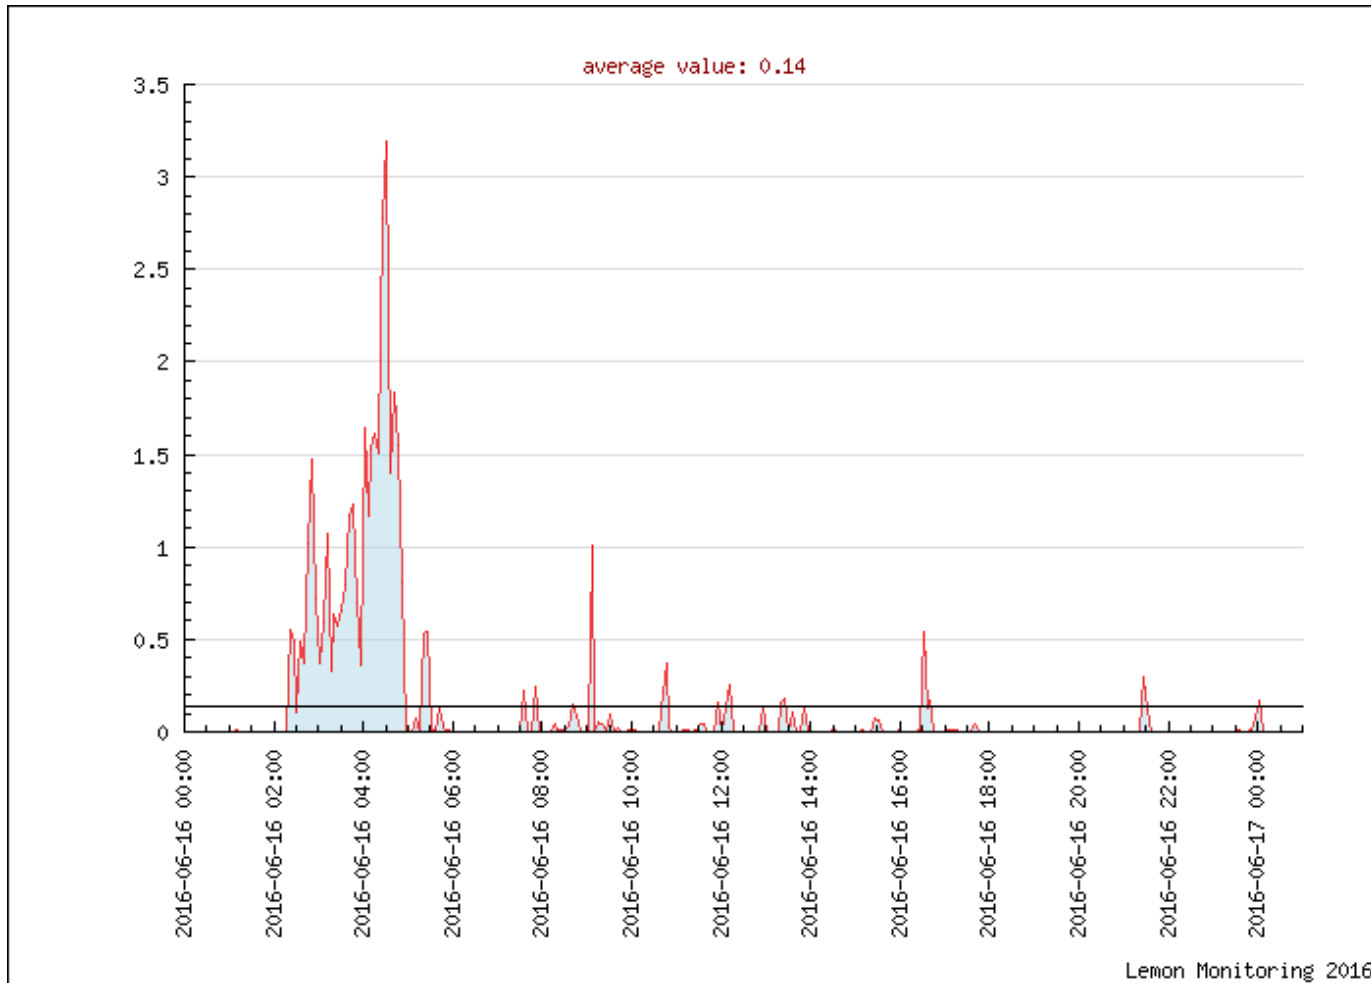

Investigation

- High load on disk observed at the time of the problematic beam dumps, leading to increased latency (I/O wait) and subsequently incomplete events being built

LVM	vg01-lv011	busy	100%	read	10947	write	2932
DSK	sdf	busy	100%	read	10947	write	0
DSK	sda	busy	0%	read	0	write	246
DSK	sdc	busy	0%	read	0	write	179
DSK	sdb	busy	0%	read	0	write	54

Investigation

Metric graph for cs-ccb-pm1 of metric: CPUUtil field: PercIOWait

Investigation

1. Data always arrived at the FE Server process (no PM data loss)
2. Other processes read/write to the disks at the same time
 - a) I/O wait increases drastically
 - b) BE server loses connection to FE server due to timeout
3. Once other processes are completed, BE-FE connection is re-established

Planned Actions

- ❑ Update firmware of HDDs (possible bug)
- ❑ Consolidate HDD types in RAID (currently a mix of SAS+SATA)
- ❑ Remove unnecessary backup processes
- ❑ Modify PowerSaver-Settings
- ❑ Reprioritize the server processes
 - a) FE and BE server: higher
 - b) Other processes: lower

Actions Taken

- ❑ Update firmware of HDDs (possible bug)
- ✓ Consolidate HDD types in RAID (currently a mix of SAS+SATA)
- ✓ Remove unnecessary backup processes
- ❑ Modify PowerSaver-Settings
- ✓ Reprioritize the server processes
 - a) FE and BE server: higher
 - b) Other processes: lower

Current Status

- No incomplete events observed since, but still experienced FE-BE connection losses
- On the 15th of July, one drive in a RAID failed on PM1
 - Drive was assigned to FE data store
 - Drive was replaced and data rebuilt without impact on operations
- Since then, no more FE-BE connection losses
