Status of Dynamic Aperture and alignment for FCC-hh

B. Dalena, D. Boutin, A. Chancé

Thanks to: J. Barranco, X. Buffat, S. Fartoukh, B. Holzer, A. S. Langner, R. Martin, D. Schoerling, D. Schulte, E. Todesco, R. Tomas, MadX and SixTrack teams...

Outline

- Motivation
- Dipole's field errors and alignment errors
- Linear and non-linear correctors
alignment and field error tolerances
- Impact of linear imperfections on Dynamic Aperture (DA)
- Impact of dipole type on DA
- Impact of Landau Damping Octupoles on DA
- Conclusions and Perspective

Motivation

- Design correction schemes for linear and non-linear errors of main magnets of the arcs
- Provide tolerances for the alignment and for the main high order multipoles components of magnets or the arcs

Key issues:

- Reserve space for correctors in the arc cells
- Get order of magnitude of correctors strengths to identify possible R&D needed
- Define tolerances on magnets alignment and main fields errors
- Define tolerances on arcs magnets field quality to ensure $DA > 12 \sigma$ at injection and much more at collision

Linear imperfections

| Element | Error | Error Descr. | Units | FCC study | LHC | Comments |
|---------|-----------------------------------|--------------|-------|-----------|------|---|
| Dipole | $\sigma(x), \sigma(y)$ | | mm | 0.5 | 0.5 | no effect on observables studied |
| | $\sigma(\theta), \delta(\varphi)$ | transv. rot. | mrad | 0.07 | ? | est. from dipole geometry and $\sigma(x/y)$ |
| | $\sigma(\psi)$ | roll angle | mrad | 0.5 | n/a | effect on vertical plane |
| | $\sigma(\delta B/B)$ | random b1 | % | 0.05 | 0.08 | LHC value includes $\sigma(\psi)$ |
| Quad | $\sigma(x), \sigma(y)$ | | mm | 0.2 | 0.36 | |
| | $\sigma(\theta), \delta(\varphi)$ | transv. rot. | mrad | 0.06 | ? | est. from quad geometry and $\sigma(x/y)$ |
| | $\sigma(\psi)$ | roll angle | mrad | 1 | 0.5 | |
| | $\sigma(\delta B/B)$ | random b2 | % | 0.1 | 0.3 | |
| BPM | $\sigma(x), \sigma(y)$ | | mm | 0.30 | 0.24 | value relative to quad |
| | $\sigma(\text{read})$ | | mm | 0.2 | 0.5 | |

Values in table correspond to 1 sigma, a Gaussian truncated to 3 sigma is used in simulations

Model of Dipole Field Quality

$$b_n = b_{n_s} + \frac{\xi_U}{1.5} b_{n_U} + \xi_R \sigma_{b_n}$$

- ξ = random number with Gaussian distribution cut at 1.5 (U) and 3 (R)
- the same seed for U for all dipoles of the same arc is used (8 different sectors as in LHC)
- different seeds for R for each dipole are used

Fractional part of tunes:

$Q_x = .28, Q_y = .31$ injection

$Q_x = .31, Q_y = .32$ collision

DA is evaluated with SixTrack adapted for FCC (SixTrack: cern.ch/sixtrack-ng)

Orbit correctors and residual orbit

- max integrated strength < 4 T m (NbTi limit)
 - quadrupole alignment tolerance might be relaxed
 - maximum residual orbit < 1 mm (at injection and at collision)
- details in David Boutin presentation tomorrow

b_2 and coupling (a_2) correctors

- interference with spurious dispersion correction \Rightarrow coupling correctors and Trims in long arc only!
 - b_2 and a_2 : all main quadrupoles or 64 Trims at 90° , skew trims at 180°
 - max trims strength < 20 T/m (R part only)
 - systematic b_2 of table v1 too high \Rightarrow can be corrected locally?
 - max skew gradient 250 T/m (table v0), 500 T/m (table v1), Length = 0.32 m (U part)
- a_2 (U) needs strong coupling correctors and gives high beta-beating
 \Rightarrow needs different correction schemes
 \Rightarrow sorting of dipoles can help
- \rightarrow details in David Boutin presentation tomorrow

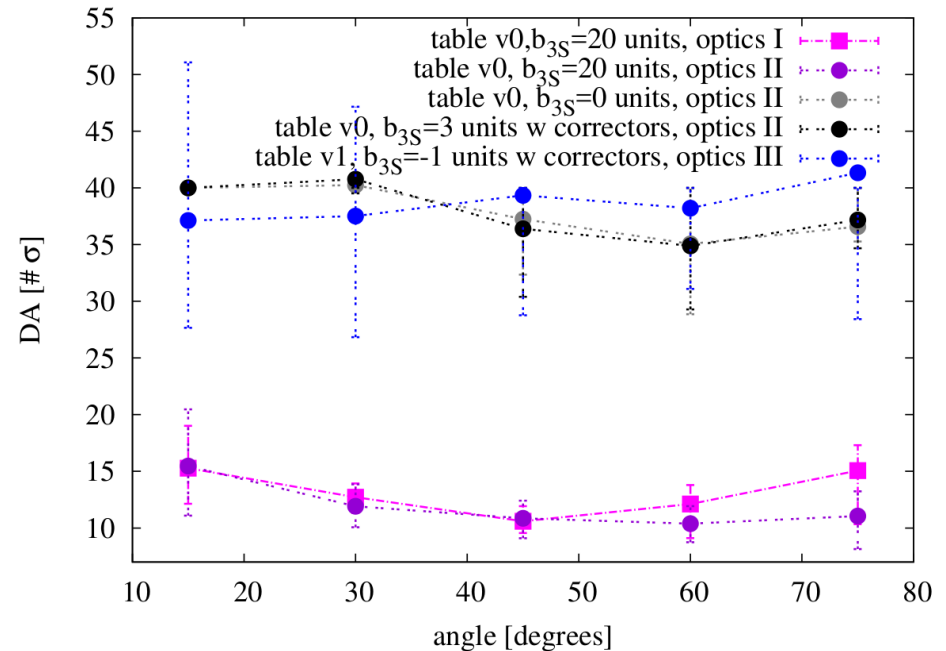

b_3 correctors and tolerance

- MCS max gradient 4430 T/m^2 , Length = 0.11 m , one corrector at each dipole
- MCS can correct up to 6 unit of systematic b_3 at collision
- a_3 correctors/tolerance to be studied

DA at collision ($\beta^* = 0.3$ m)

- DA at collision is dominated by the systematic b_3 dipole error
 - tolerance of systematic component of $b_3 \leq 3$ unit at collision
 - for the new layout at collision (optics III) minimum DA $> 40 \sigma$ (table v0)
- \Rightarrow DA at collision due to dipole field quality $> 26 \sigma$

Optics I: 99.97 km layout, $L^*=36$ m, $\beta^*=4.6$ m and max momentum collimation dispersion 4 m

Optics II: 99.97 km layout, $L^*=36$ m, $\beta^*=3.5$ m and max momentum collimation dispersion 5 m

Optics III: 97.75 km layout, $L^*=45$ m, $\beta^*=4.6$ m and momentum collimation scaled from LHC

N.B. crossing scheme and final triplet errors NOT considered in these simulations (see A. Seryi & E. Cruz talks)

DA at injection

- DA at injection is **dominated** by the **random dipole errors**
- 15-20 unit of systematic b_3 , due to persistent current, can be corrected
- min DA 13.9 σ (table v0)
12.1 σ (table v1)
- no need for b_4 and b_5 correctors

Optics I: 99.97 km layout, $L^*=36$ m, $\beta^*=4.6$ m and max momentum collimation dispersion 4 m

Optics II: 99.97 km layout, $L^*=36$ m, $\beta^*=3.5$ m and max momentum collimation dispersion 5 m

Optics III: 97.75 km layout, $L^*=45$ m, $\beta^*=4.6$ m and momentum collimation scaled from LHC

b_4 tolerance

main dipole errors **table v0**:

- b_5 feed-down is not critical
- systematic $b_4 < 0.142$ at injection fine

main dipole errors **table v1**:

- same tolerance should be fine... to be checked

⇒ b_4 correctors not required

table v0

| b_{4S} | b_{4R} | min DA [σ] |
|------------------------------|--------------------------|---------------------|
| 0 (nom) | 0.065 (nom) | 14.6 |
| 0.0284 (b_5 feed-down) | 0.239 (b_5 feed-down) | 13.9 |
| 0.142 (b_5 feed-down x5) | 0.239 (b_5 feed-down) | 11.8 |
| 0.284 (b_5 feed-down x10) | 0.239 (b_5 feed-down) | 10.5 |

b_5 tolerance

main dipole errors **table v0**:

- detuning with amplitude and with momentum dominated by the systematic b_5 component
- systematic $b_5 < 2$ at injection fine

main dipole errors **table v1**:

- detuning with momentum dominated by a_4
- same tolerance should be fine... to be checked
 $\Rightarrow b_5$ correctors not required

| b_{5s} | min DA [σ] |
|----------|---------------------|
| -1 (nom) | 14.6 |
| -2 | 11. |
| -3 | 9. |

table v0

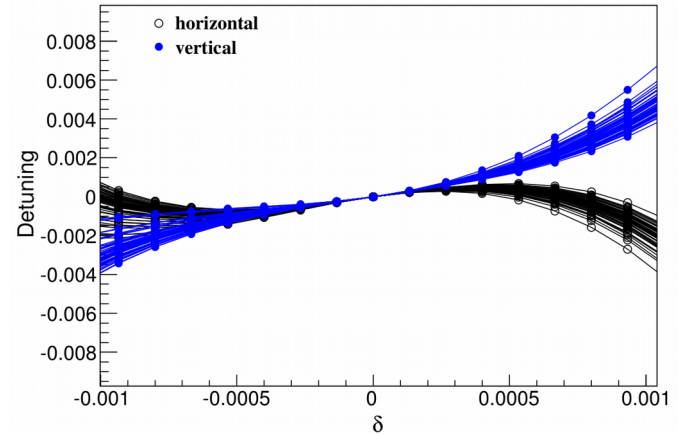

table v1

Impact of linear imperfections

- dipole field quality table v0 at injection
- linear errors and correction applied to 50 different seeds
- **minimum DA unchanged** or slightly better than without linear imperfections
- average DA better than without linear imperfections

Impact of dipole type

$$B_y + iB_x = B_{ref} \sum_{n=1}^{\infty} (b_n + ia_n) \left(\frac{x + iy}{R_{ref}} \right)^{n-1}$$

$$b_{3err} = b_5 \cdot 6 \cdot \left(\frac{x_S}{R_{ref}} \right)^2 = 6 \cdot (b_{5S} + b_{5U} + b_{5R}) \cdot \left(\frac{x_S}{R_{ref}} \right)^2 \sim b_{5S} \cdot 0.13 = -0.13$$

- the value is less than the random component of b_3 , that dominates the DA at injection
- the additional error is systematic for each dipole \Rightarrow correctable by the pool pieces

Impact of Landau Octupoles

- ~460 octupoles can be installed in Long Arcs
- $G_{\max} = 220000 \text{ T/m}^3$, Length = 0.32m, $I_{\max} = 720 \text{ A}$
- $K_{\text{MO}} = (G_{\max}/B\rho) (I_{\text{oct}}/I_{\max})$
(50/energy)

⇒ important reduction of DA!

| | $I_{\text{oct}} \text{ [A]}$ | min DA [σ] |
|-----|------------------------------|---------------------|
| inj | 1 | 8.7 |
| | 10 | 1.2 |
| | 30 | < 1 |
| col | 720 | 13 |

main dipole errors table v1 included

Conclusions

- Alignment tolerances almost defined
- Orbit correctors feasible in NbTi technology
- b_2 and a_2 (coupling) correction more difficult... need different schemes
- b_3 correctors feasible in NbTi technology
- b_4 and b_5 correctors not required and tolerances to be checked with new dipole field errors table
- Impact of linear imperfections on DA small (...to be further investigated)
- Impact of dipole type on DA small and correctable
- Impact of Landau Damping Octupoles on DA important!

Perspectives

- Follow up of the studies presented
- Define a_3 correctors and assess b_4 , a_4 , b_5 , a_5 tolerances for new table
- Impact of main quadrupole field quality
- Impact of residual linear imperfections coming from IRs and of final triplet field quality at injection
- Tune scan
