What is needed for effective open access workflows?

Wednesday, 22 March 2017 11:30 (15 minutes)

Institutions and funders are pushing forward open access with ever new guidelines and policies. Since institutional repositories are important maintainers of green open access, they should support easy and fast workflows for researchers and libraries to release publications. Based on the requirements specification of researchers, libraries and publishers, possible supporting software extensions are discussed. How does a typical workflow look like? What has to be considered by the researchers and by the editors in the library before releasing a green open access publication? Where and how can software support and improve existing workflows?
