2. An algebraic formulation of causality for noncommutative geometry

On a Lorentzian manifold with metric g , tangent vectors can be classified in different groups:

- v is spacelike if $g(v, v) > 0$
- v is causal (timelike or null) if $g(v, v) \leq 0$

Two points are causally related, with $p \preceq q$, if and only if there is a future directed causal curve from p to q , i.e. a curve whose tangent vector is causal everywhere.

Two points are causally related, with $p \preceq q$, if and only if there is a future directed causal curve from p to q , i.e. a curve whose tangent vector is causal everywhere.

The notion is purely geometric and needs to be algebraized using the elements of a Lorentzian spectral triple.

In particular, we want a relation between the pure states of the algebra, since there are in one-to-one correspondance with the points of the manifold.

- $(\mathcal{A}_F, H_F, D_F)$ is a noncommutative (Riemannian) spectral triple constructed in the following way:
 - $\mathcal{A}_F = M_2(\mathbb{C})$
 - $\mathcal{H}_F = \mathbb{C}^2$
 - $D_F = \text{diag}(d_1, d_2), \quad d_1, d_2 \in \mathbb{R}, \quad d_1 \neq d_2$

The fundamental symmetry of the product is given by $\mathcal{J} = i\gamma^0 \otimes 1$.

- $|d_1 - d_2|$ is a constant defined by the eigenvalues of the operator D_F of the internal space.

This condition can be seen as a constant upper bound to the ratio between a distance in the internal space and a proper time in the continuous space, and can be interpreted as a *constant speed of light* existing within the finite space.

We can equip our space with the following fermionic action:

$$S_F = (\psi, D\psi) = \langle \psi, \mathcal{J}D\psi \rangle$$

If $\psi = \psi_+ \otimes \begin{pmatrix} 1 \\ 0 \end{pmatrix} + \psi_- \otimes \begin{pmatrix} 0 \\ 1 \end{pmatrix}$ is divided between the chirality eigenstates, this action reads

$$S_F = \int_{\mathcal{M}} \left[\psi_-^* D_{\mathcal{M}} \psi_- + \psi_+^* D_{\mathcal{M}} \psi_+ + m(\psi_-^* \psi_+ + \psi_+^* \psi_-) \right]$$

which is the action describing a single Dirac fermion of mass m propagating in a curved spacetime \mathcal{M} .

Restoring the physical dimensions on the causality constraint, we get :

$$(p, -) \preceq (q, +) \iff p \preceq q \text{ and } l(\gamma) \geq \frac{\pi \hbar}{2|m|c^2} = \frac{T_{\text{ZB}}}{2}$$

So Zitterbewegung can be interpreted as a particule moving as the maximal speed within the internal space.

On the 2-dimensional Minkowski space $\mathbb{R}^{1,1}$, the Moyal Lorentzian spectral triple $(\mathcal{A}, \tilde{\mathcal{A}}, \mathcal{H}, D, \mathcal{J})$ is constructed in the following way:

- $\mathcal{H} = L^2(\mathbb{R}^{1+1}) \otimes \mathbb{C}^2$ with the usual positive definite inner product
- \mathcal{A} is the space of Schwartz functions $\mathcal{S}(\mathbb{R}^{1,1})$ with the "Weyl-Moyal" \star product defined as

$$(f \star g)(x) := \frac{1}{(\pi\theta)^2} \int d^2y d^2z f(x+y)g(x+z)e^{-2iy^\mu \Theta_{\mu\nu}^{-1}z^\nu},$$

$$\text{with } \Theta_{\mu\nu} := \theta \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix}, \theta > 0$$

The coherent states of \mathcal{A} are the vector states defined, for any $\kappa \in \mathbb{C}$, by:

$$\varphi_m = \frac{1}{\sqrt{2\pi\theta}} e^{-\frac{|\kappa|^2}{2\theta}} \frac{\kappa^m}{\sqrt{m! \theta^m}}$$

The coherent states correspond to the possible translations under the complex scalar $\sqrt{2}\kappa$ of the ground state $|0\rangle$, using $\kappa \in \mathbb{C} \cong \mathbb{R}^{1,1}$.

They are the states that minimize the uncertainty equally distributed in position and momentum. The classical limit of the coherent states, when $\theta \rightarrow 0$, corresponds to the usual pure states on $\mathbb{R}^{1,1}$, hence to the points of the usual Minkowski space. (P. When taking the limit $\theta \rightarrow 0$, we recover the usual causality on Minkowski with all sheets merged and usual translations of points.

This model represents waves packets under causal translations with a lower bound on time in order to change the energy level. However, the testability of this lower bound is problematic since, restoring physical dimensions, it is of the order of the Plank time.

From the same limit of the causal condition, one can also recover the energy-momentum dispersion relation $E^2 = m^2 + p^2$ for a fermion traveling on the product of 4D-Minkowski and two-points.

(A. Watcharangkool, M. Sakellariadou 2017)

We could postulate that, on almost-commutative spacetimes, every particles "move" at a maximal constant speed c , where this speed is calculated from a kind of "pythagorean" relation between the continuous spacetime and the internal space.

This would automatically imply that:

- The relation $E^2 = m^2 + p^2$ is implied by this geometrical principle
- Massive particles can move freely with speed less than c , and have a remaining internal movement (Zitterbewegung)
- Massless particles move on the continuous spacetime always at speed c (since the internal space is reduced to one point)
