Contribution ID: 1194

Type: Talk

Quantum measurements in finite space-time domain

The talk is devoted to discussion of space-time domain finiteness effects for quantum Unruh-DeWitt detector which operates in this domain. We discuss a special

renormalization procedure which happens to be different in finite and infinite domain cases. It is demonstrated that, as is typical for renormalization, a new dimensionfull parameter appears, having meaning of detector's recovery proper time. It plays no role at the leading order of perturbation theory but can be important non-perturbatively. We analyse the structure of finite time corrections to various observables. It is found that in large-time limit they can be described in a universal way, in a sense, and non-vanishing in adiabatic limit effects are of special interest. As an application, Landauer's principle interpretations for finite domain case are studied.

Topic:

Mini-workshop: Continuous Variables and Relativistic Quantum Information

Summary

Author: SHEVCHENKO, Vladimir (National Research Centre Kurchatov Institute (RU))
Presenter: SHEVCHENKO, Vladimir (National Research Centre Kurchatov Institute (RU))
Session Classification: Workshop on continuous variables and quantum information

Track Classification: Workshop on Cont. Variables and Rel. Quantum Information
