Kolymbari, Crete, Greece
August 19th-29th 2017*

Motivations

- Measurement of **space-time parameters** of the particle emitting source **at kinetic freeze-out**
- **Different particle species** are sensitive to various effects (Final State Interactions (FSI), transport properties, asymmetries, etc...)
- Pion femtoscopic parameters are measured in the Beam Energy Scan program at RHIC (AGS, SPS, LHC, ...)
- **Pion interferometry** in Au+Au collisions **at $\sqrt{s_{NN}} = 14.5 \text{ GeV}$** (not yet published)
- **Extending transverse mass region** (up to $1 \text{ GeV}/c^2$) using particle identification from the Time-Of-Flight detector
- **Kaon femtoscopy**: provides complementary information because they are less affected by resonance decays, contain strange quark, heavier than pions

Correlation function

- Two-particle correlation function:

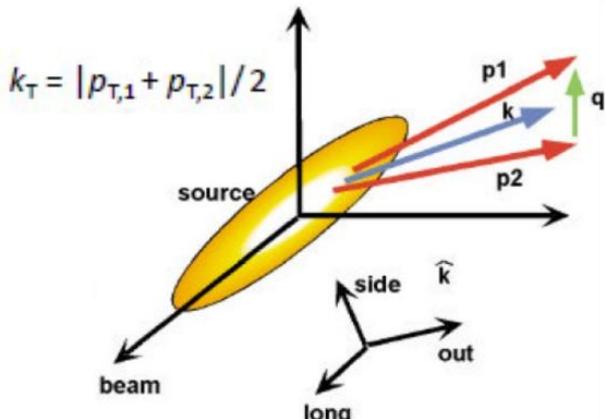

$$CF(p_1, p_2) = \int d^3r S(r, k) |\Psi_{1,2}(r, k)|^2$$

$$r = x_1 - x_2 \text{ and } q \equiv q_{\text{inv}} = p_1 - p_2$$

- Experimentally:

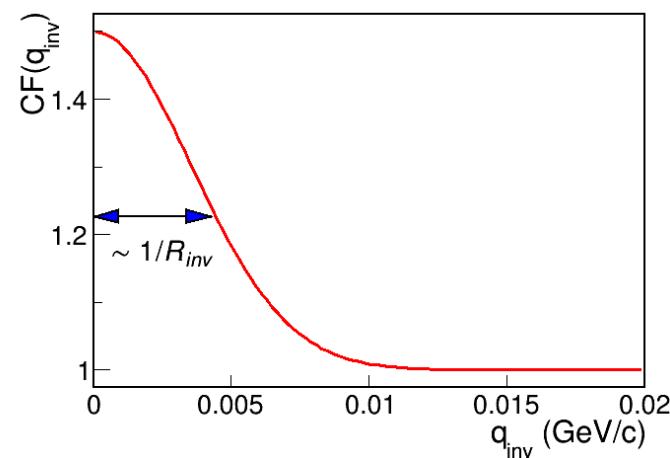

$$CF(q) = A(q)/B(q)$$

- $A(q)$ – contain quantum statistical (QS) correlations and final state interactions (FSI)
- $B(q)$ – obtained via mixing technique (does not contain QS and FSI)

S. Pratt. Phys. Rev. D 33 (1986) 1314

G. Bertsch. Phys. Rev. C 37 (1988) 1896

The relative pair momentum can be projected onto the Bertsch-Pratt, **out-side-long system**:

q_{long} – along the beam direction

q_{out} – along the transverse momentum of the pair

q_{side} – perpendicular to longitudinal and outward directions

Correlation functions are constructed in Longitudinally Co-Moving System (LCMS), where $p_{1z} + p_{2z} = 0$

Fitting procedure

- Femtoscopic radii are extracted by fitting $C(\mathbf{q})$ with (Bowler-Sinyukov procedure):

$$C_2(q_{out}, q_{side}, q_{long}) = N(1 - \lambda + \lambda K(q_{inv})(1 + \exp(-R_{out}^2 q_{out}^2 - R_{side}^2 q_{side}^2 - R_{long}^2 q_{long}^2)))$$

M. Bowler. Phys. Lett. B 270 (1991) 69

N – normalization factor λ – correlation strength Yu. Sinyukov et al. Phys. Lett. B 432 (1998) 248

$K(q_{inv})$ – Coulomb correction

R_{side} ~ geometrical size of the system

R_{out} ~ geometrical size + particle emission duration

R_{long} ~ medium lifetime

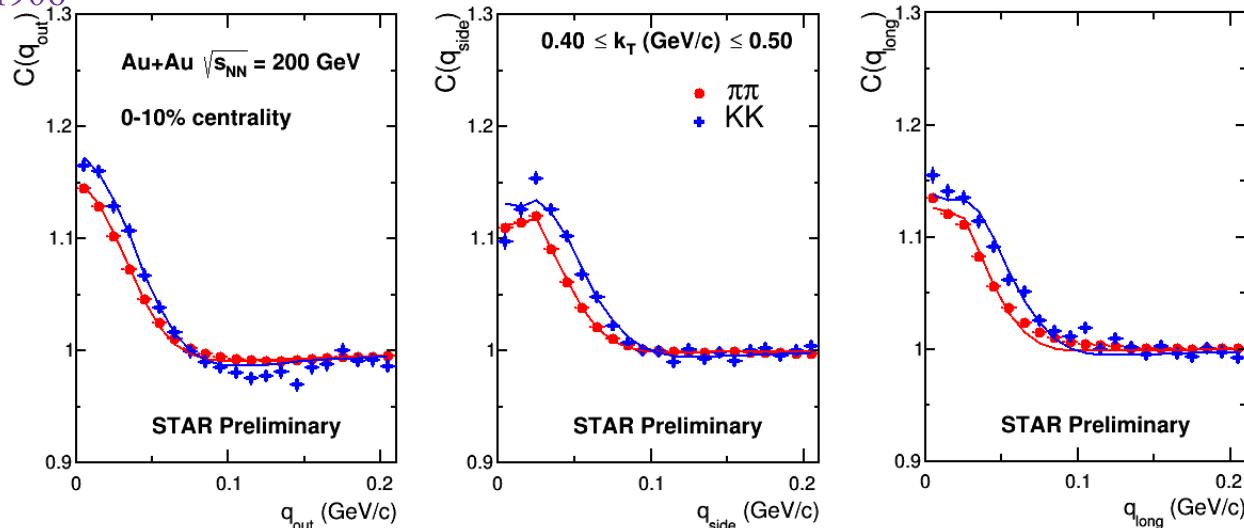

- Fit using Log-likelihood method:
E-802. Phys. Rev. C 66 (2002) 054906

$$\chi^2 = -2 \left[A \ln \left(\frac{C(A+B)}{A(C+1)} \right) + B \ln \left(\frac{A+B}{B(C+1)} \right) \right], C = \frac{A}{B}$$

functions

Fit shows a good description
of the data

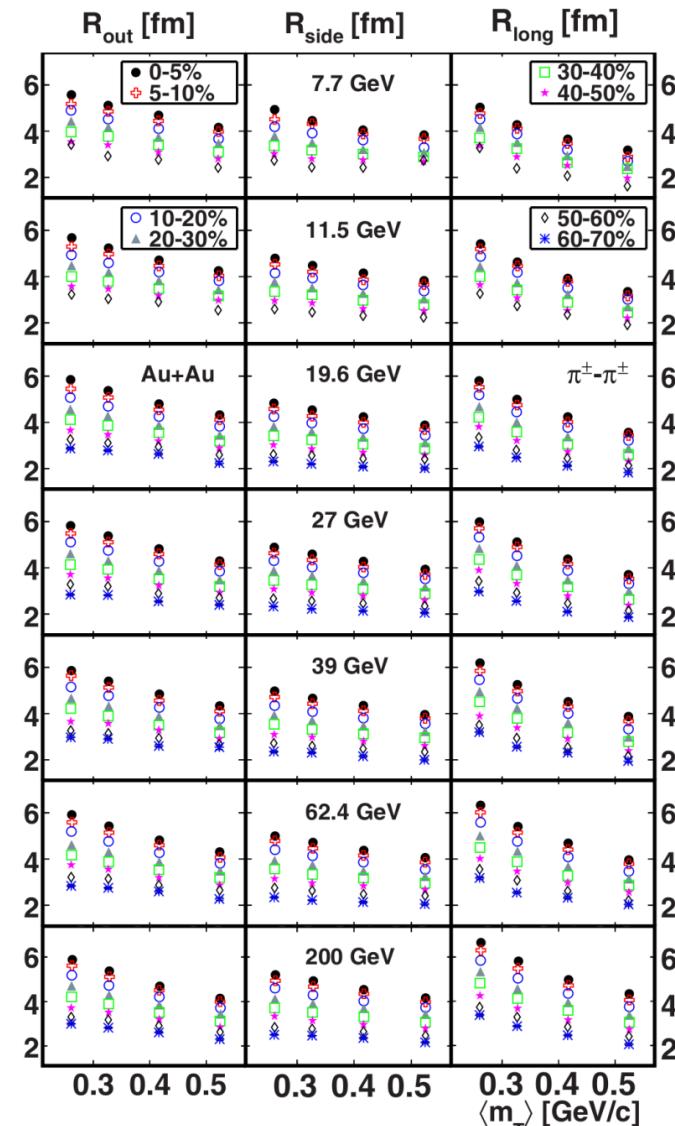

Solenoidal Tracker At RHIC

- Large acceptance mid-rapidity detector: $0 < \phi < 2\pi$ and $|\eta| < 1$
- Excellent particle identification:
 - dE/dx from TPC
 - $1/\beta (m^2)$ from TOF

Pion femtoscopy in STAR

STAR, PRC 92 (2015) 014904

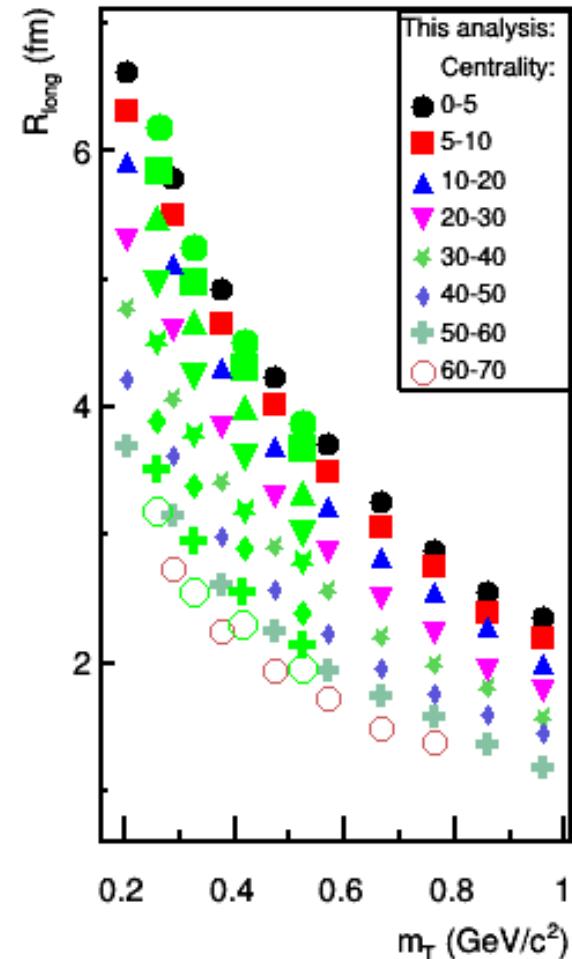

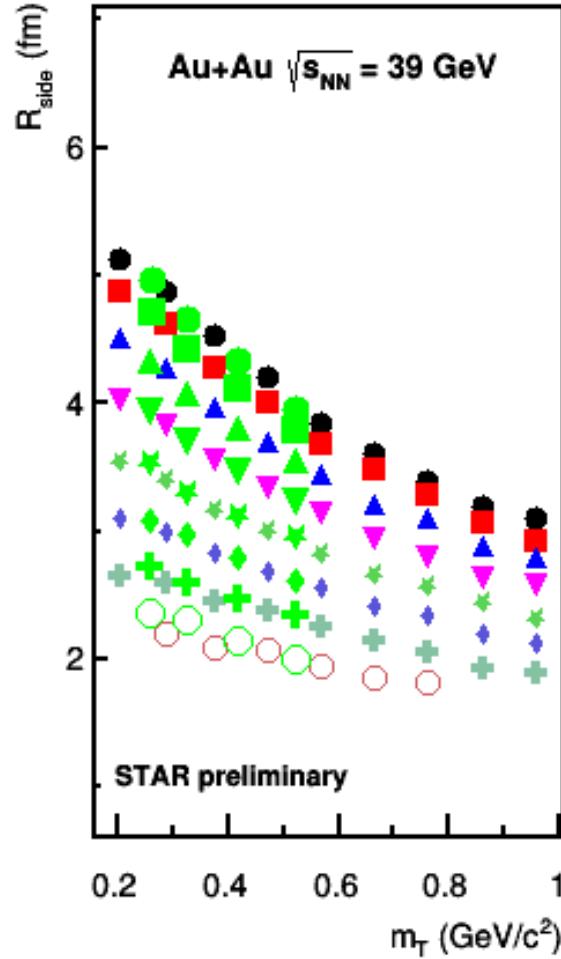

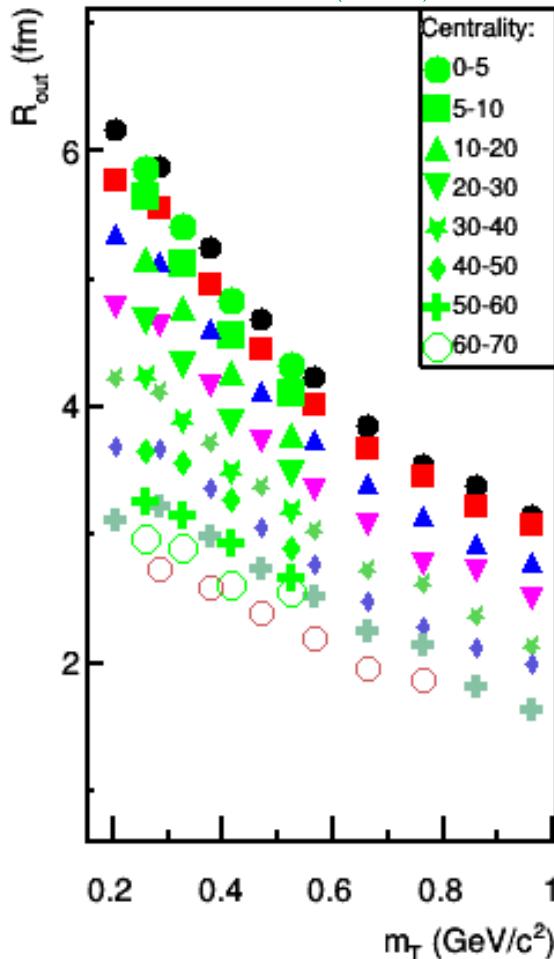

- Pion correlations have been **extensively measured in STAR**
- The decrease of the femtoscopic radii with increasing transverse mass $m_T = \sqrt{k_T^2 + m^2}$ is attributed to the hydrodynamic flow in heavy-ion collisions
- To make the comparison with kaons, the extension to the higher m_T is needed.
- Particle identification with TPC and TOF

Event and pair cuts	Same as in STAR, PRC 92 (2015) 014904
Track cuts:	$ \eta < 1, n\text{Hits} > 15$
PID:	$0.15 < p(\text{GeV}/c) < 0.45$
if no TOF (dE/dx)	$\pi: n\sigma_\pi < 2, n\sigma_{\text{other}} > 2$ $K: n\sigma_K < 2, n\sigma_{\text{other}} > 2$
PID: If TOF ($m^2 + dE/dx$)	$0.15 < p(\text{GeV}/c) < 1.45$ $\pi: n\sigma_\pi < 3, -0.02 < m_\pi^2 (\text{GeV}/c^2)^2 < 0.062$ $K: n\sigma_K < 3, 0.20 < m_K^2 (\text{GeV}/c^2)^2 < 0.32$

Comparison to the published data

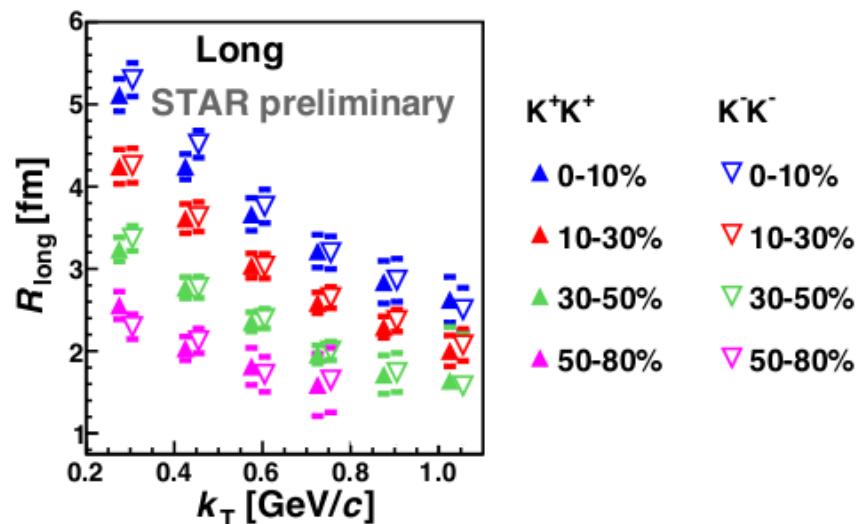

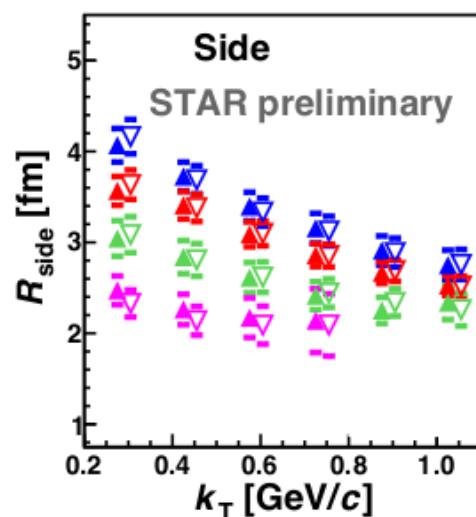

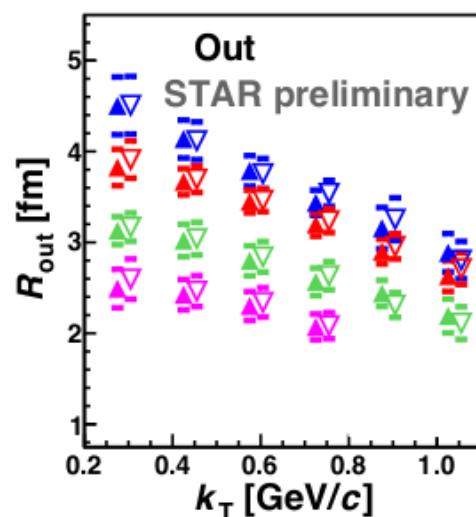

STAR, PRC 92 (2015) 014904

1. Extracted femtoscopic parameters are in a good agreement with the published data for all collisions centralities and transverse mass intervals
2. Can be done for all BES energies: 7.7, 11.5, 14.5, 19.6, 27, 39, 62.4, 200 GeV

Charged kaons

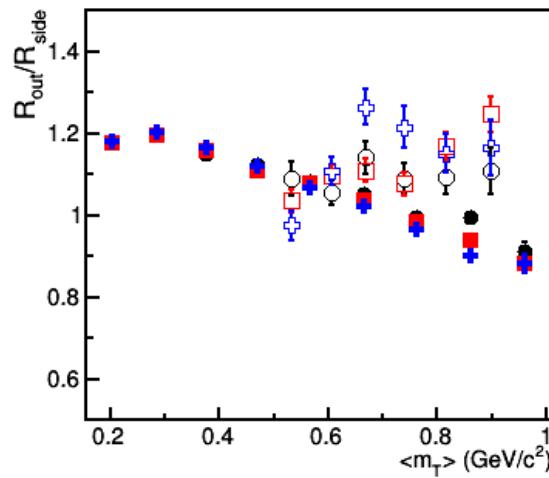

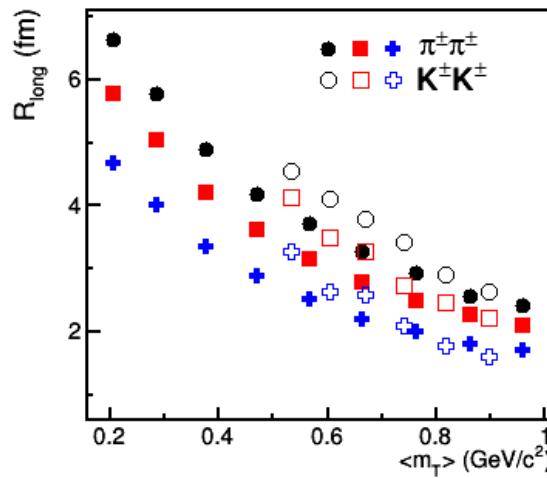

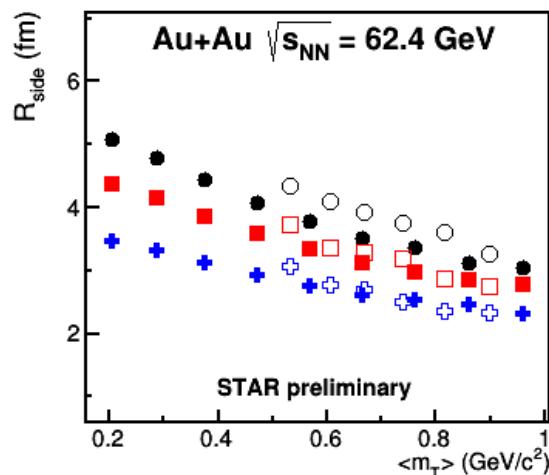

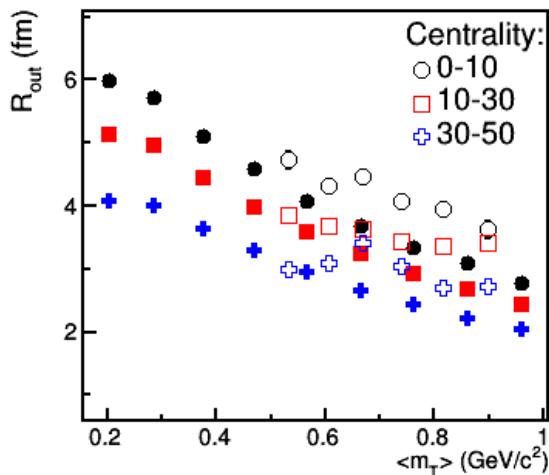

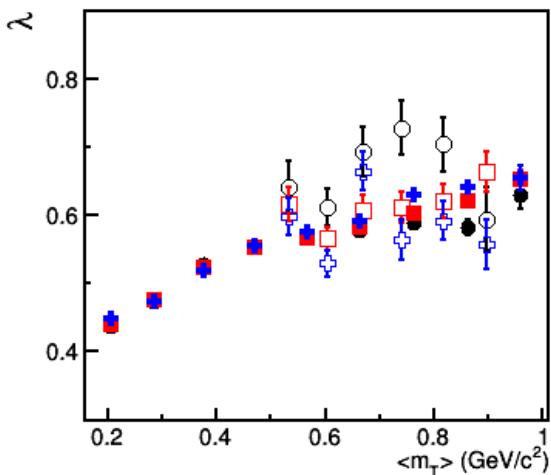

Au+Au $\sqrt{s_{NN}} = 200$ GeV

1. Measured femtoscopic radii for positive and negative kaon pairs agree with each other within the uncertainties
2. Extracted radii decrease with increasing transverse momentum – influence of the collective radial flow

S. Akkelin et al. Phys. Lett. B 356 (1995) 525

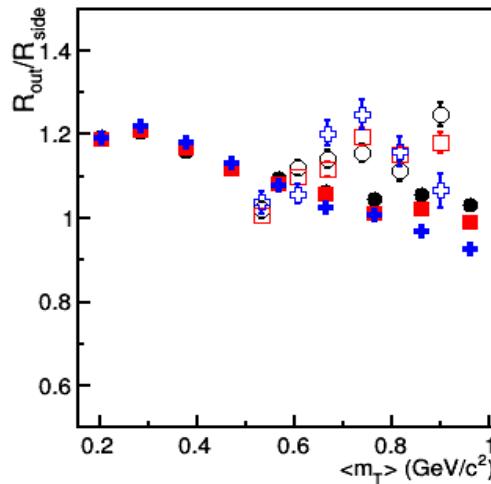

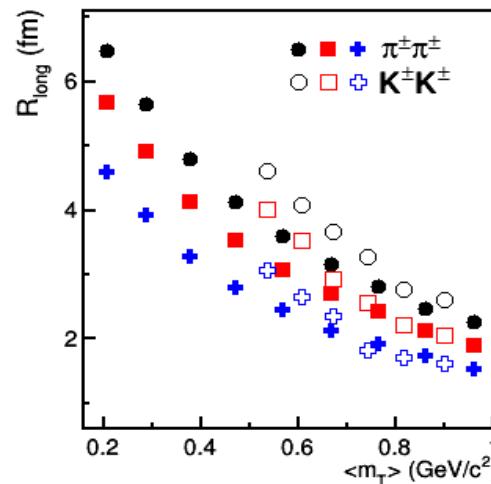

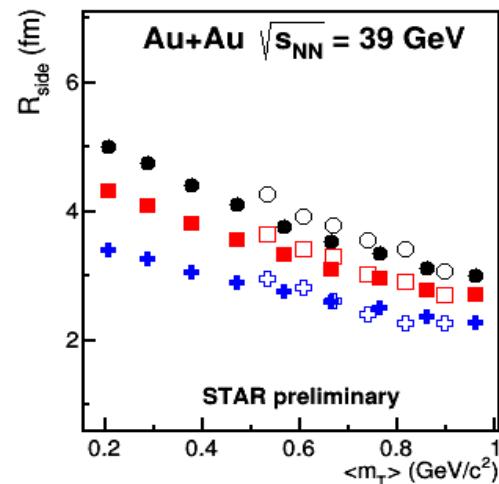

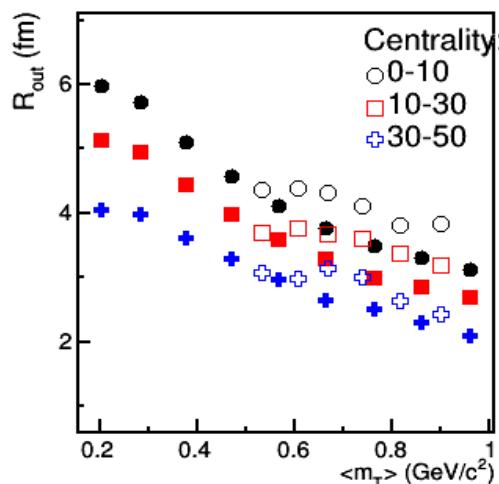

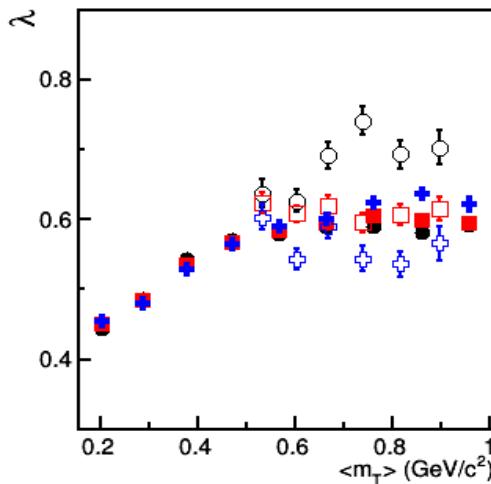

KK and $\pi\pi$ femtoscopy at $\sqrt{s_{NN}}=62.4$ GeV

Statistical errors only

- Kaon femtoscopic radii in outward and longitudinal directions are generally larger than those for pions at the same m_T → **breaking of the m_T -scaling**
- In the sideward direction, the pion and kaon radii are similar

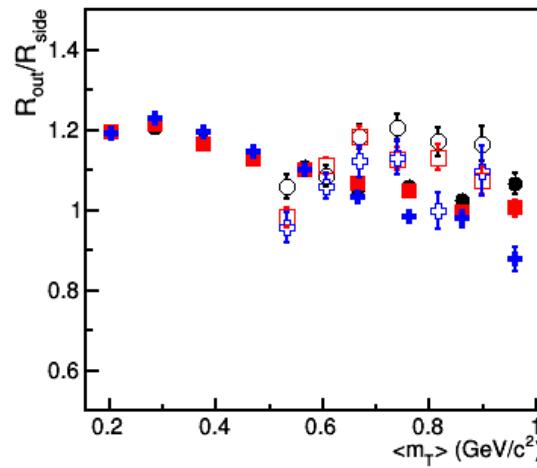

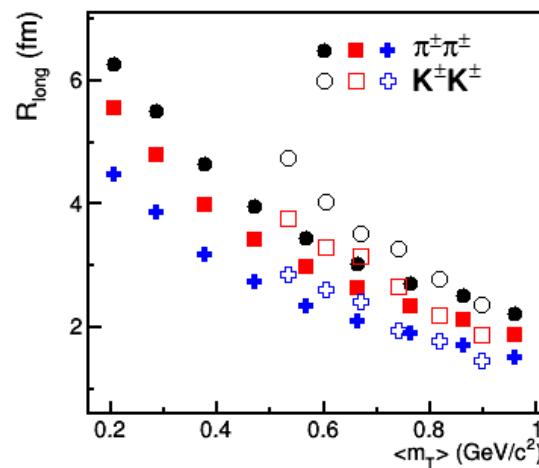

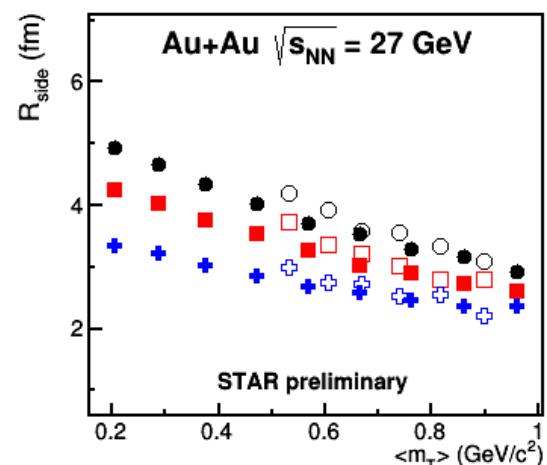

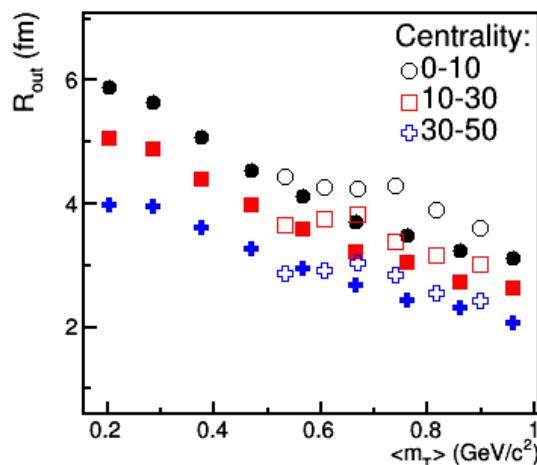

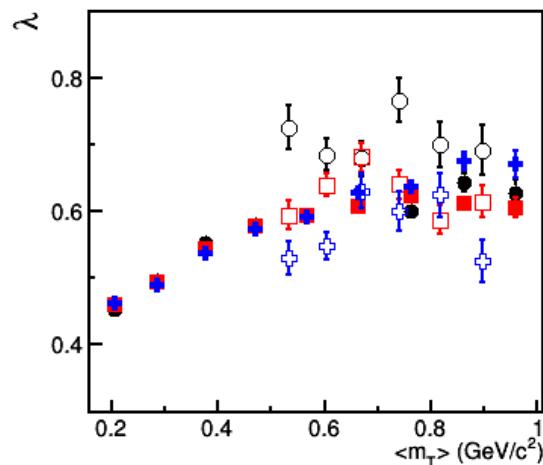

KK and $\pi\pi$ femtoscopy at $\sqrt{s_{NN}}=39$ GeV

Statistical errors only

- Kaon femtoscopic radii in outward and longitudinal directions are generally larger than those for pions at the same m_T → **breaking of the m_T -scaling**
- In the sideward direction, the pion and kaon radii are similar

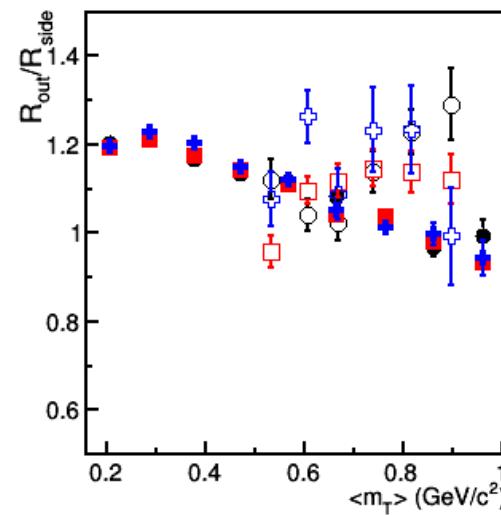

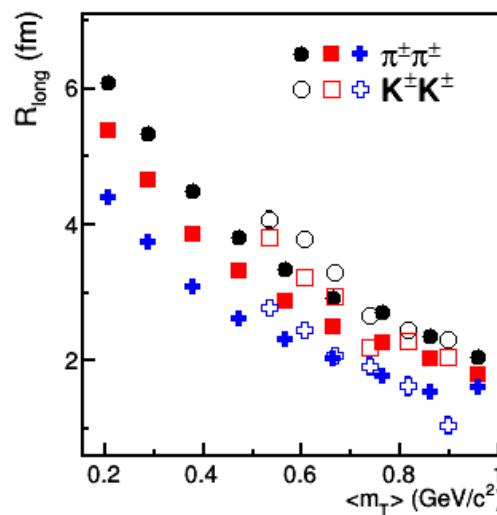

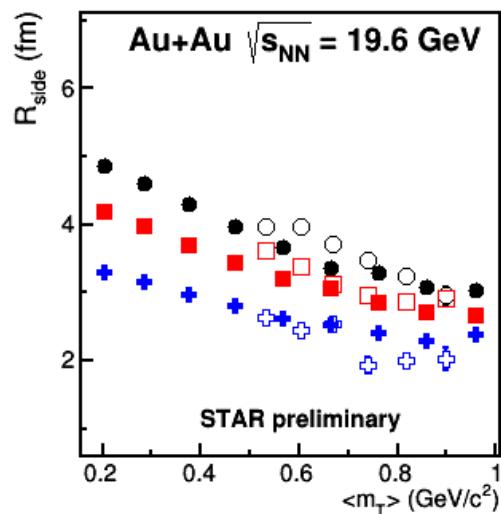

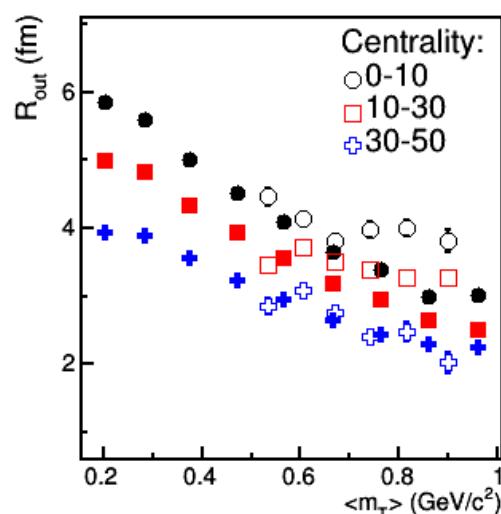

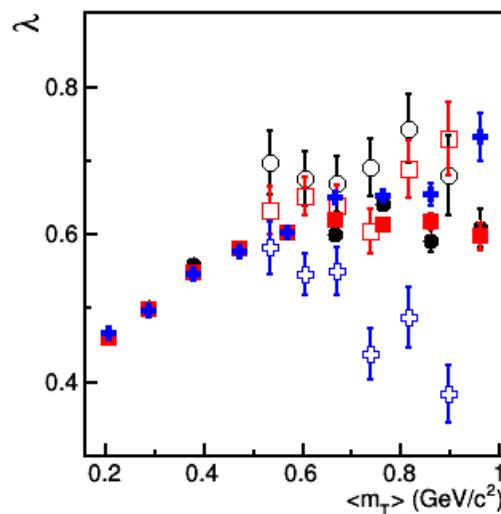

KK and $\pi\pi$ femtoscopy at $\sqrt{s_{NN}}=27$ GeV

Statistical errors only

- Kaon femtoscopic radii in outward and longitudinal directions are generally larger than those for pions at the same m_T → **breaking of the m_T -scaling**
- In the sideward direction, the pion and kaon radii are similar

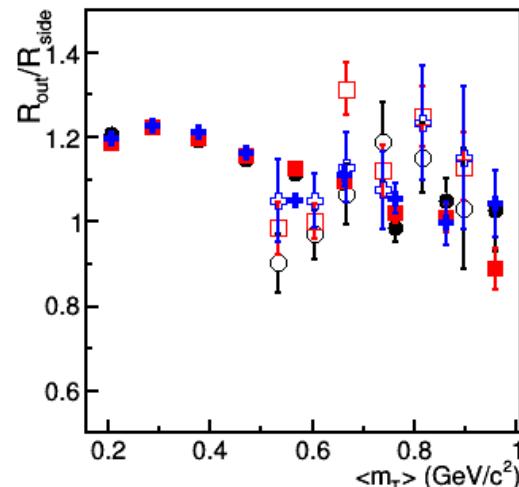

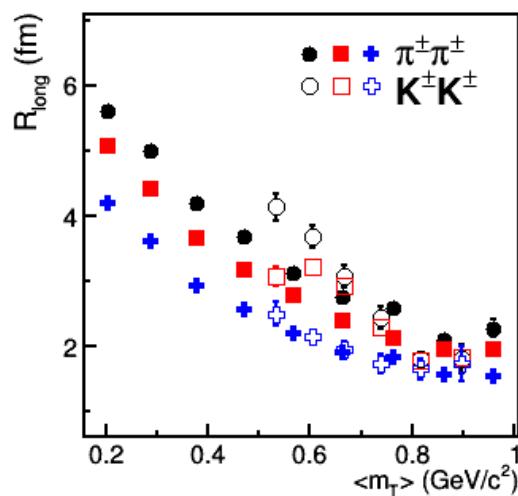

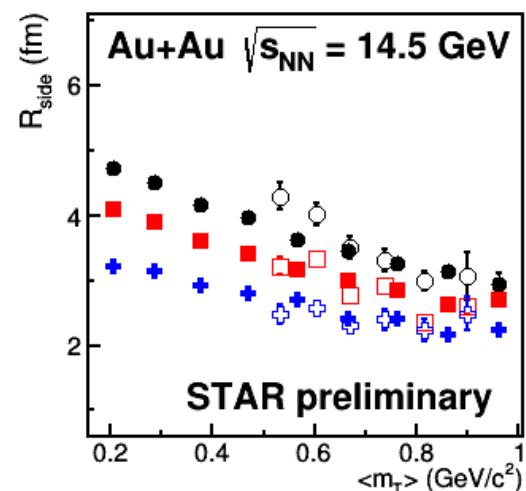

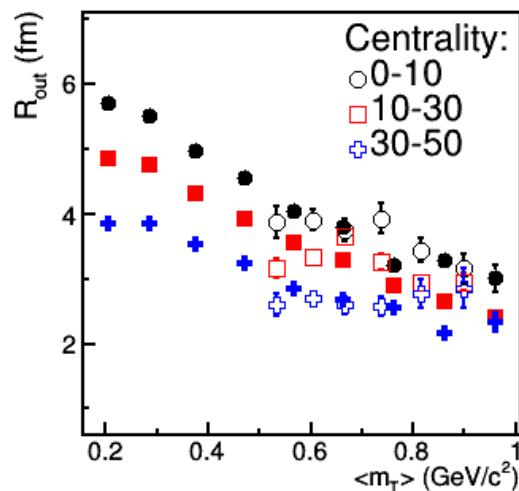

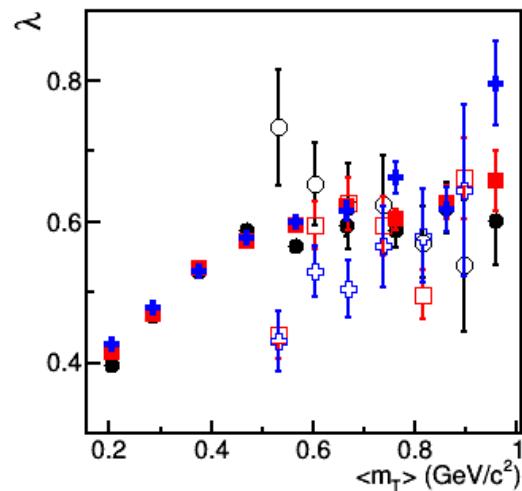

KK and $\pi\pi$ femtoscopy at $\sqrt{s_{NN}}=19.6$ GeV

Statistical errors only

- Less differences between kaon and pion femtoscopic parameters at energies below 19.6 GeV

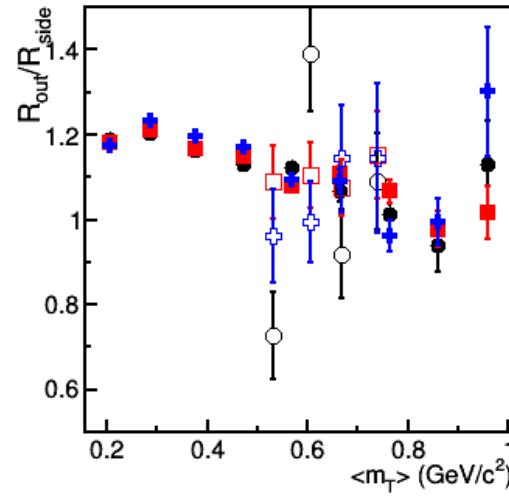

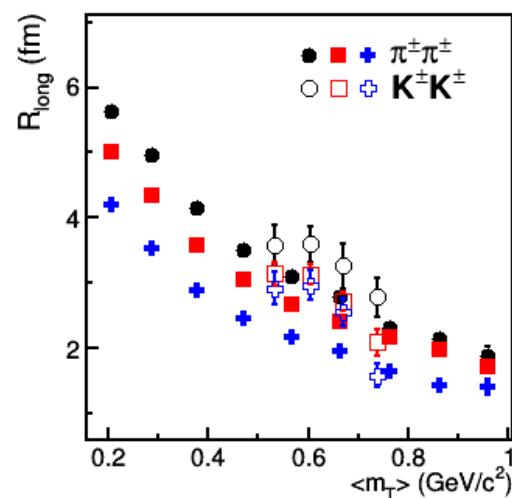

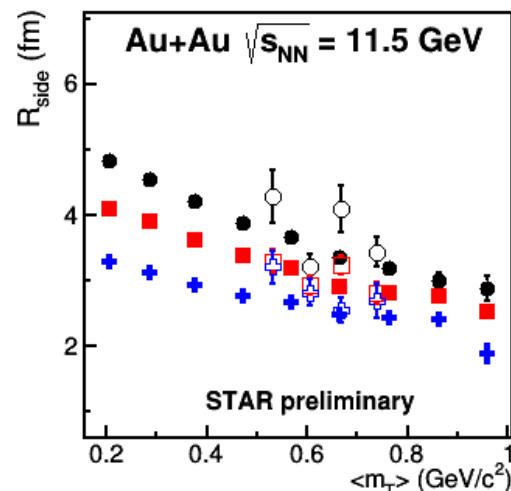

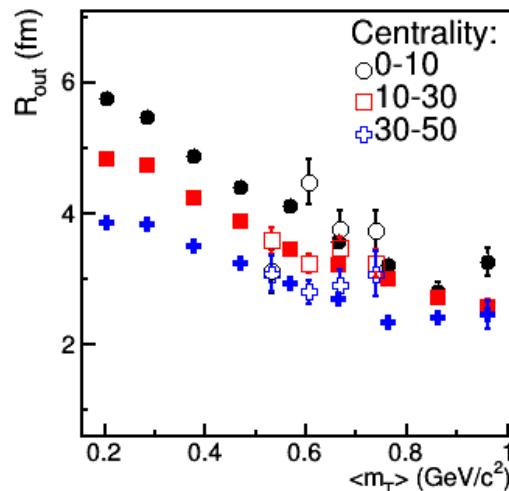

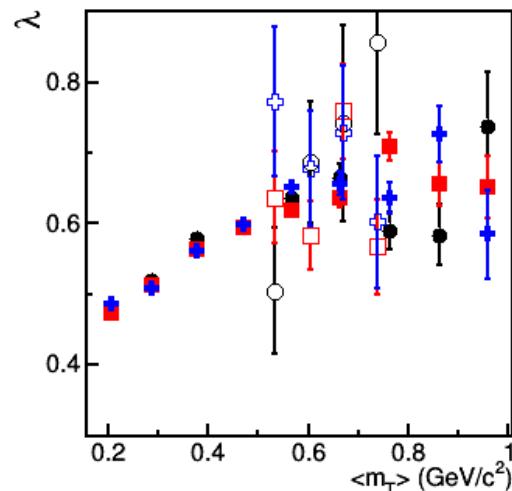

KK and $\pi\pi$ femtoscopy at $\sqrt{s_{NN}}=14.5$ GeV

Statistical errors only

- Less differences between kaon and pion femtoscopic parameters at energies below 19.6 GeV

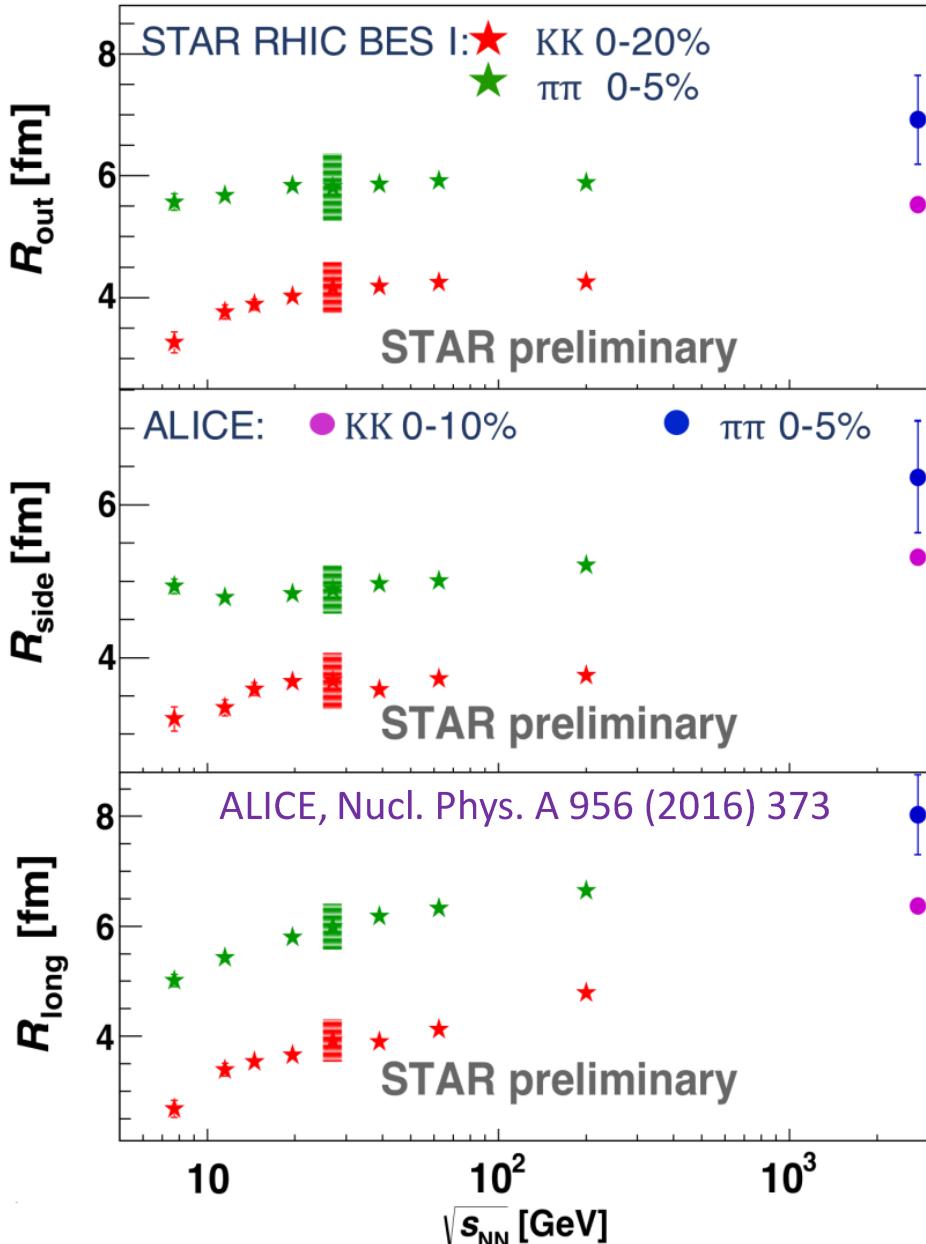

KK and $\pi\pi$ femtoscopy at $\sqrt{s_{NN}}=11.5 \text{ GeV}$

Statistical errors only

- Less differences between kaon and pion femtoscopic parameters at energies below 19.6 GeV

Results from the BES phase-I

The extracted femtoscopic radii smoothly increase with increasing collision energy

The values of R_{out} and R_{side} for both pions and kaons show a very small increase at the RHIC energies and rise at the LHC

The values of R_{long} suggest that the system lives longer at the LHC energy

Summary:

- Centrality dependence of the $\pi\pi$ and KK femtoscopic parameters is measured for Au+Au collisions at 11.5, 14.5, 19.6, 27, 39, 62.4 and 200 GeV
- Pion results (with the extended m_T region) are consistent with the published data
- Pion and kaon radii seem to follow different m_T dependencies
- R_{out} , R_{side} and R_{long} for pions and kaons smoothly increase with increasing energy

Search for the differences in K^+K^+ and K^-K^-

Spherical harmonic decomposition of the K^+K^- correlation function
(by Jindřich Lidrych at 16th Zimányi school)

- Example of SHD of CF
- For all BES energies $Re\{A_{1,1}(Q_{total})\}$ vanish within errors
- There isn't asymmetry between particle sources -> we can merge K^+K^+ & K^-K^- pairs for BES energies
