## Searches for electroweak production of supersymmetric gauginos and sleptons with the ATLAS detector

*Saturday 19 August 2017 16:55 (25 minutes)*

Many supersymmetry models feature gauginos and also sleptons with masses less than a few hundred GeV. These can give rise to direct pair production rates at the LHC that can be observed in the data sample recorded by the ATLAS detector. The talk presents results from searches for gaugino and slepton pair production in final states with leptons or long-lived particles, using the data collected during the LHC Run 2.
