Introduction

Generation I model

- Assumptions and Implications
- A possible Gauge invariant version
- Consequences of Gauge Invariance

Going Beyond: 2HDM

- Adding a second doublet
- Type I II
- Type III and FCNC

3 Conclusions

Just one additional scalar coupled with generic couplings $g_q y_i, y_\chi$

$$\mathcal{L}_{new} = \frac{1}{2} \partial^{\mu} S \partial_{\mu} S - \frac{1}{2} M^2 S^2 - g_q S \sum_q y_i \bar{q}_i q_i - y_{DM} S \bar{\chi} \chi$$

The interaction term of S with quarks is not gauge invariant, as

$$\bar{q}_i q_i = \bar{q}_L^i q_R^i + \bar{q}_R^i q_L^i$$

is not SM singlet

Getting a Gauge Invariant version of this model could tell us some additional constraints on the mass of the additional scalar, on the size of the couplings

Introduction

Generation I model

Assumptions and Implications

- A possible Gauge invariant version
- Consequences of Gauge Invariance

Going Beyond: 2HDM

- Adding a second doublet
- Type I II
- Type III and FCNC

3 Conclusions

Assumptions

- S is a scalar, and is a portal to DM
- χ is a SM singlet
- S is exchanged in the s-channel
- Structure of SM yukawa lagrangian is not modified
- There is only one Higgs doublet

Implications

- S is a SM singlet
- *S* has to mix with SM higgs, as a quark scalar bilinear can only couple to a particle that has the same quantum numbers as an Higgs doublet

3 Conclusions

Introduction A possible Gauge invariant version

A Gauge invariant version of this model could be obtained by the following lagrangian (Z_2 on S)

$$\mathcal{L}_{new} = \frac{1}{2} \partial^{\mu} S \partial_{\mu} S + \frac{1}{2} M_{SS}^2 S^2 - \frac{1}{2} \lambda_{HS} \phi^{\dagger} \phi S^2 - \frac{1}{4!} \lambda_S S^4 - y_{DM} S \bar{\chi} \chi$$

EW symmetry breaking mixes the SM higgs with the new scalar

$$\left(\begin{array}{c}h\\s\end{array}\right) = \left(\begin{array}{c}\cos\epsilon & \sin\epsilon\\-\sin\epsilon & \cos\epsilon\end{array}\right) \left(\begin{array}{c}h'\\S\end{array}\right)$$

The mixing angle ϵ has to be small, so that higgs and EW phenomenology does not get affected much (all SM signal strengths involving the higgs get a $\cos^2 \epsilon$ factor)

Already discussed in "Dark matter model with two s-channel mediators" [1606.07609], more on Summary of [1607.06680]

The h - s mixing gives s a coupling to Standard Model fermions:

$$\mathcal{L}_{int} = -y_i \bar{Q}_L^i u_R^i \widetilde{\phi} = -m_i \bar{u}_L^i u_R^i (1 + \cos \epsilon \frac{h}{v} - \sin \epsilon \frac{s}{v})$$

The coupling of s to quarks is indeed proportional to yukawas

$$g_q = -\frac{1}{\sqrt{2}}\sin\epsilon$$

$$\sigma_{\bar{q}q\to\bar{\chi}\chi} \propto (y_{\chi}y_q\sin\epsilon\cos\epsilon)^2 \Big(\frac{1}{s-M_h^2} - \frac{1}{s-M_s^2}\Big)^2$$

The mixing requires also the Higgs to couple to DM, and the product of the couplings for *h* and *s* is equal and opposite

The gauge-invariant version of this simplified model is therefore

$$L = L_{SM}|_{h \to \cos \epsilon h - \sin \epsilon s} + \frac{1}{2} \partial^{\mu} S \partial_{\mu} S - \frac{1}{2} M_s^2 S^2 + \bar{\chi} (i\partial - m_{\chi}) \chi - y_{DM} (\cos \epsilon S + \sin \epsilon h) \bar{\chi} \chi$$

So the interactions relevant for monojet are

$$L_{int,s-h} = -(\cos\epsilon h - \sin\epsilon S) \sum_{q} \frac{m_i}{v} \bar{q}_i q_i - y_{DM}(\cos\epsilon S + \sin\epsilon h) \bar{\chi}\chi$$

However there are also other interactions that are first order in ϵ

$$L_{int,VBF} = -\sin\epsilon \left(2\frac{M_W^2}{v}W_{\mu}^+W^{-\mu} + \frac{M_z^2}{v}Z_{\mu}Z^{\mu}\right)s$$

Introduction

- Generation I model
- Assumptions and Implications
- A possible Gauge invariant version
- Consequences of Gauge Invariance

Going Beyond: 2HDM

- Adding a second doublet
- Type I II
- Type III and FCNC

3 Conclusions

- $g_q = \sin \epsilon / \sqrt{2} \le 1$ means low to moderate sensitivity
- Higgs couples to DM
- Stringent DD constraints on ϵ , even $M_s \to \infty$ (but not for $M_s \sim M_h$)
- DD blind window at $M_s \sim M_h$ [1509.05771]
- Too weak signal at LHC unless at least one of the 2 mediators can go on shell
- Bounds on h invisible give stringent constraints for $m_\chi \lesssim M_h/2$
- Well approximated by Gen I if only one of the 2 mediators can go on shell
- Any case where both mediators can go on shell is not well described by Gen I model

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

3

- Assumptions and Implications
- A possible Gauge invariant version ۲

Going Beyond: 2HDM

- Adding a second doublet
- Type I II
- Type III and FCNC

- Conclusions of the previous slides are quite general
 - A more complex scalar sector would still lead to similar conclusions
- To get more freedom with couplings to quarks, the only way is to add an additional Higgs doublet
- New Lagrangian will contain the singlet *S* as well, for a total of 3 scalars
- The 3 scalars will in general mix with arbitrary mixing angles
 - There is always a region of the parameter space where one can decouple the first doublet and make it SM-like $\cos(\beta \alpha) = 0$
 - In that case *S* mixes only with the scalar of the second doublet, and there is no constraints on the mixing angle

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

SM phenomenology doesn't get affected in this limit, and no VBF operator arises

Introduction

- Generation I model

- A possible Gauge invariant version
- Consequences of Gauge Invariance

Going Beyond: 2HDM

- Adding a second doublet
- Type I II
- Type III and FCNC

3 Conclusions

Going Beyond: 2HDM

In the alignment limit $(\beta - \alpha = \pi/2)$, ones gets

$$L = L_{SM} + \frac{1}{2} \partial^{\mu} S_i \partial_{\mu} S_i - \frac{1}{2} M_i^2 S_i^2 (i = 1, 2) + \bar{\chi} (i\partial - m_{\chi}) \chi - y_{DM} (\cos \theta S_2 + \sin \theta S_1) \bar{\chi} \chi - \frac{y_f \xi^f}{\sqrt{2}} (\cos \theta S_1 - \sin \theta S_2) \bar{f} f$$

	Type I	Type II	
ξ^u	$\cot eta$	$\cot eta$	
ξ^d	\coteta	aneta	
ξ^ℓ	$\cot \beta$	an eta	

- β is unconstrained, however if we want the top coupling to be perturbative ones needs $\cot \beta < \sqrt{4\pi} \rightarrow \tan \beta > 0.28$
- Type II can allow an enhanced coupling to down quarks, for large values of $\tan\beta$

Introduction

Going Beyond: 2HDM

- Adding a second doublet
- Type I II
- Type III and FCNC

ConclusionsSummary

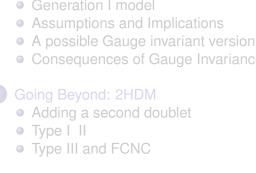

Choosing the SM Yukawa matrices to be (before digonalizing)

$$V^{\dagger}y_h^u, y_h^d, y_h^l \qquad (y_{h\,ij}^f = \sqrt{2}\frac{m_{f_i}}{v}\delta_{ij})$$

we can choose the yukawa matrices for the second doublet to be instead some new arbitrary diagonal matrices y_H

$$V^{\dagger}y_{H}^{u}, y_{H}^{d}, y_{H}^{l}$$

- This yukawa structure means the fermion mass matrices and yukawa matrices for both doublets are simultaneously diagonalizable
- Flavor loop constrains have to be taken into account
- Large parameter space
- The only model that can decouple leptons (or quarks, or a specific particle)
- Simple flavour-protected case $y_H^u = \tan \gamma_u y_h^u$, $y_H^d = \tan \gamma_d y_h^d$, $Y_H^l = \tan \gamma_l y_h^l$ (Aligned Yukawa [10

ConclusionsSummary

Model	Singlet	Type I	Type II	Type III
2 Mediators	Yes	Yes	Yes	Yes
$MAX \; g_q$	$\frac{\sin\epsilon}{\sqrt{2}}$	$\sqrt{4\pi}$	$\begin{array}{c} q_u < \sqrt{4\pi} \\ g_d < \frac{m_t}{m_b} \sqrt{4\pi} \end{array}$	$\frac{m_t}{m_q}\sqrt{4\pi}$
VBF	Yes	No	No	No
SM constr.	Yes	No	No	No
Num. Par.	$4(+1\Gamma)$	6 (+2Γ)	6 (+2Γ)	14 ($+2\Gamma$)
NFC	N/A	Yes	Yes	No
MFV	Yes	Yes	Yes	Yes
Flavour constr.	No	Moderate	Moderate	Depends

Э.

- Single scalar mediator
 - not gauge invariant wrt SM symmetries
- Singlet mixed with SM Higgs
 - Simple model, can be studied in details without "simplifying" it
 - Many constrains from SM physics
- Singlet plus 2 Higgs doublets
 - Necessary to go beyond the above
 - Interesting case in the alignment limit
 - S mixes with 2nd Higgs, thus no Higgs mixing constraints
 - Flavour diagonal (*but not necessarily Yukawa suppressed*) couplings forbid tree-level FCNC
 - Arbitrary diagonal couplings allow large LHC signals
 - Large parameter space for Type III can be "simplified" with flavor constrains
