

File Syncing Technology Advancement in Seafile -- Drive Client and Real-time Backup Server

Johnathan Xu
CTO, Seafile Ltd.

What is Seafile?

VS

Seafile is a fast and reliable Open Source file sync & share solution

What can Seafile do?

- Comprehensive cloud storage features
- Fast and reliable file sync
- High performance, light weight
- No maintenance headache

Used by about 20 educational institutes world wide

Seafile Drive Client

How do we use cloud storage today?

- File Syncing

- Pros

- Automatically sync files across devices
 - Access anywhere: web, mobile, desktop
 - Easy to share files
 - Access offline

- Cons

- 1TB cloud space vs. 256GB local SSD drive
 - Selective sync is not intuitive to setup
 - “Why do I need to replicate all those files?”

How do we use storage before?

- Windows Share/Samba/NFS
 - Pros
 - Intuitive: access remote files like local files
 - Access files on-demand, no need to replicate
 - Is this how “cloud storage” should look like?
 - Cons
 - Cannot access offline
 - No web and mobile access
 - Slow in WAN
 - (Almost) no way to share files

“The best of both worlds”?

How about WebDAV?

- Map WebDAV as network drive
 - Pros
 - Can be used to map cloud storage as local drive
 - Most OS supports it out of box
 - Cons
 - Many redundant requests since the OS thinks it's local
 - Large file handling problems
 - Slow to upload many files
 - No offline access

Seafiler Drive Client

Devices and drives (4)

Floppy Disk Drive (A:)

Local Disk (C:)

11.0 GB free of 59.5 GB

Seadrive (S:)

4.44 GB free of 4.65 GB

Network locations (2)

The screenshot shows a Windows File Explorer window titled "test-rename" with the address bar set to "This PC > Seadrive (E:) > test-rename". The left sidebar shows the navigation pane with "Seadrive (E:)" selected. The main pane displays a list of 19 items:

Name	Date modified	Type	Size
3	10/25/2016 8:19 PM	File folder	
abc	3/19/2016 10:55 AM	File folder	Window Snip
eee	8/31/2016 1:35 PM	File folder	
test	11/21/2015 5:11 PM	File folder	
test2	11/1/2016 5:41 PM	File folder	
a (SFConflict xjqkilling@gmail.com 2015-...	9/27/2015 10:39 AM	Text Document	1 KB

How it works

- Good from Windows Share
 - Map Seafile cloud storage as virtual drive. Browse files without syncing them.
 - Files are downloaded on demand. No unnecessary storage consumption.
 - Convenient and intuitive to use.
- Good from file syncing
 - File/folder list fully cached locally
 - Accessed files are cached locally for offline access
 - Manually cache folders/files for slow network or offline access (To be done). Replace “selective sync” function.
 - Can change files offline.
 - Easily share files

How it works

Use Cases

- Satisfy 90% of file syncing use cases
- Replace Windows Share or Samba with Seafile.
- Access files on workstations with small local disk.
- Writing large scientific data directly to Seafile server.
- Better enforcement of data access regulations.
Users access files from Seafile server exclusively.
The locally cached files can be removed on logout.

Demo

Performance

	SeaDrive	WebDAV	Windows Share
Copy out a 253MB file	6.6s	9.5s	5.4s
Read 10 positions in a 243MB file, read 1MB on each position	0.69s	9.8s	0.45s
Copy in a 253MB file	2.2s copy + 4s upload	11.6s	5.4s
Copy in a folder with 699 files, total 9MB	5s copy + 2s upload	8m9s	5s
Copy out a folder with 293 files, total 38MB	31s	36s	2s

Seafile Real-time Backup Server

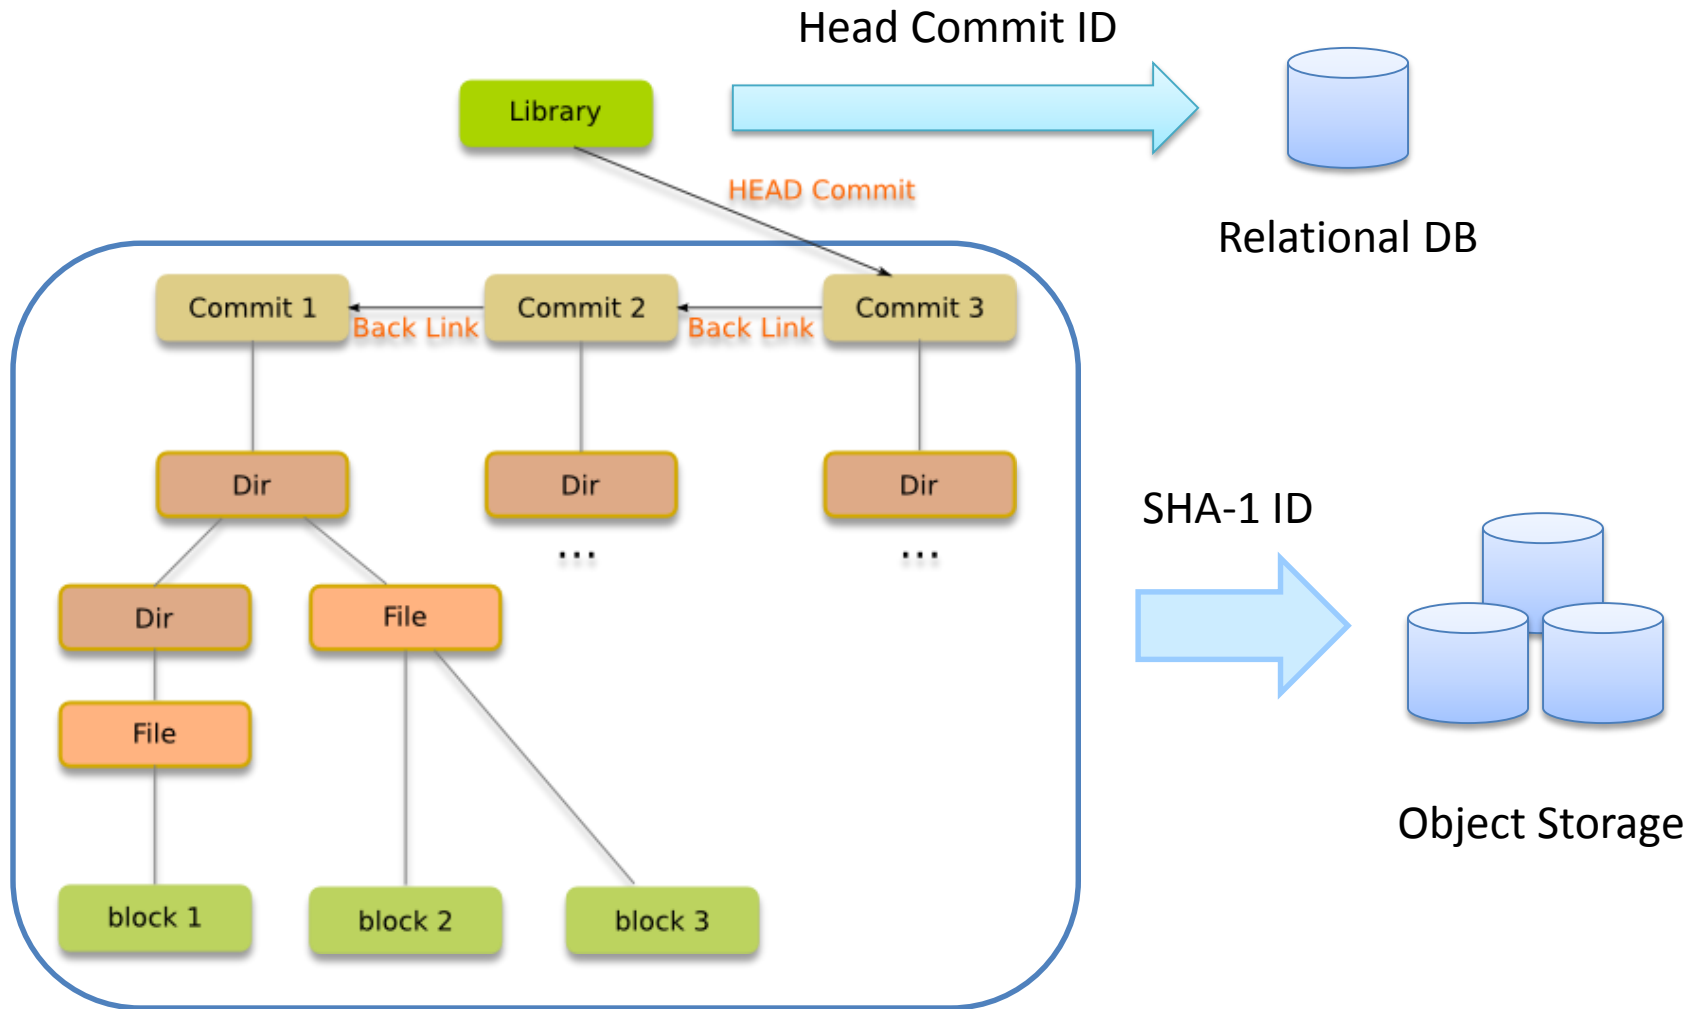

Regular vs. Real-time Backup

- Regular backup
 - Backup the database and files from one server to another in fixed periods
 - Backup window: data written between backups are lost
 - DB and files may be inconsistent with each other
- Real-time backup
 - Smaller backup window: continuous, incremental backup from primary to backup server
 - DB and files are always consistent

Seafile File System Design

Data model similar to Git

How it works

- Sync libraries from primary server to backup server, with Seafiler's syncing algorithm
 - Complete history of library is synced
 - Head commit info in the database is synced too
 - Auto detect updates on the primary server, nearly real-time
- All other information in the database is synced with MySQL replication
 - Sharing, ownership, etc.

Use Cases

- Continuous protection of Seafile data
- Multi-site replication
- High availability with geo-replicated hot backup

Thank You!
