### Data Comparison

RHIC at few energies

Elliptic flow of identified hadrons in Au+Au collisions at

$$\sqrt{s_{NN}} = 7.7 - 62.4 \text{ GeV}$$

L. Adamczyk et al. [STAR Collaboration], Phys. Rev. C 88 (2013) 014902

Measurements of the elliptic flow,  $v_2$ , of identified hadrons  $(\pi^{\pm}, K^{\pm}, K_s^0, p, \overline{p}, \phi, \Lambda, \overline{\Lambda}, \Xi^-, \overline{\Xi}^+, \Omega^-, \overline{\Omega}^+)$  in Au+Au collisions at  $\sqrt{s_{NN}} = 7.7, 11.5, 19.6, 27, 39$  and 62.4 GeV are presented.

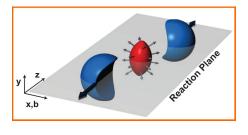

Here, we compare at 19.6 GeV

We use the same method of STAR to compare Data and Results

Anisotropic Flow

Direct evidence of flow: anisotropy in particle momentum distributions correlated with the reaction plane.

R. Snellings, New J. Phys. 13 (2011) 055008

Anisotropic Flow

A way of characterizing the various patterns of anisotropic flow is to use a Fourier expansion :

$$E\frac{d^3N}{d^3\mathbf{p}} = \frac{1}{2\pi} \frac{d^2}{p_t dp_t dy} \left( 1 + 2\sum_{n=1}^{\infty} \mathbf{v_n} \cos\left[n(\phi - \psi_{RP})\right] \right)$$

 $E: energy\ of\ the\ particle\ ;\ p: momentum\ ;\ pt: transverse\ momentum\ ;\ \varphi: azimuthal\ angle\ ;\ y: \\ rapidity\ ;\ \psi_{RP}: reaction\ plane\ angle.$ 

Anisotropic Flow

A way of characterizing the various patterns of anisotropic flow is to use a Fourier expansion :

$$E\frac{d^3N}{d^3\mathbf{p}} = \frac{1}{2\pi} \frac{d^2}{p_t dp_t dy} \left( 1 + 2\sum_{n=1}^{\infty} \mathbf{v_n} \cos\left[n(\phi - \psi_{RP})\right] \right)$$

E : energy of the particle ; p : momentum ; pt : transverse momentum ;  $\phi$  : azimuthal angle ; y : rapidity ;  $\psi_{RP}$  : reaction plane angle.

Anisotropic Flow: (n=1: Directed Flow, n=2: Elliptic Flow)

$$v_n(pt, y) = \langle \cos [n(\phi(pt, y) - \psi_{RP})] \rangle$$

Eta-Sub: Event Plane Method

Event Flow vector (projection of azimuthal angle):

$$Q_{n,x} = \sum_{i} w_i \cos(n\phi_i) = Q_n \cos(n\Psi_n)$$

$$Q_{n,y} = \sum_{i} w_{i} \sin(n\phi_{i}) = Q_{n} \sin(n\Psi_{n})$$

The sum goes over all particles i used in *the event plane calculation*.  $\phi_i$  and  $w_i$  are the lab azimuthal angle and weight for particle

Where  $\Psi_n$  the event plane angle :

$$\Psi_n = \tan^{-1} \left( \frac{\sum_i w_i \sin(n\phi_i)}{\sum_i w_i \cos(n\phi_i)} \right) / n$$

Eta-Sub: Event Plane Method

$$v_n^{\text{obs}}(p_T, y) = \langle \cos[n(\phi_i - \Psi_n)] \rangle$$

Average over all particles in all events with their azimuthal angle  $\phi_i$  in a given rapidity and  $p_T$  momentum space.

Eta-Sub: Event Plane Method

$$v_n^{\text{obs}}(p_T, y) = \langle \cos[n(\phi_i - \Psi_n)] \rangle$$

Average over all particles in all events with their azimuthal angle  $\phi_i$  in a given rapidity and  $p_T$  momentum space.

$$\mathscr{R} = \langle \cos[n(\Psi_n - \Psi_{RP})] \rangle$$

average over all events

Eta-Sub: Event Plane Method

$$v_n^{\text{obs}}(p_T, y) = \langle \cos[n(\phi_i - \Psi_n)] \rangle$$

Average over all particles in all events with their azimuthal angle  $\phi_i$  in a given rapidity and  $p_T$  momentum space.

Eta-sub method : two planes defined by negative (A) and positive (B) pseudorapidity with  $\approx$  equal multiplicity :

$$\mathscr{R}_{n,sub} = \sqrt{\langle \cos[n(\Psi_n^A - \Psi_n^B)] \rangle}$$

Eta-Sub: Event Plane Method

$$v_n^{\text{obs}}(p_T, y) = \langle \cos[n(\phi_i - \Psi_n)] \rangle$$

Average over all particles in all events with their azimuthal angle  $\phi_i$  in a given rapidity and  $p_T$  momentum space.

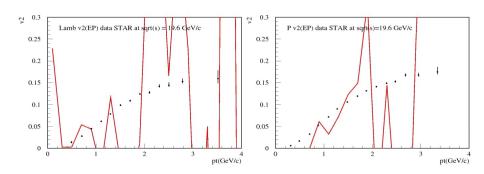

Eta-sub method : two planes defined by negative (A) and positive (B) pseudorapidity with  $\approx$  equal multiplicity :

$$\mathscr{R}_{n,sub} = \sqrt{\langle \cos[n(\Psi_n^A - \Psi_n^B)] \rangle}$$

The final flow coefficients are :  $v_n = \frac{v_n^{\text{obs}}}{\mathcal{R}_{n.sub}}$ 

# Results : $v_2$ vs $p_t$

#### **Bad Results!**

Unified Approach Elliptic Flow Results Conclusion

Old Results

### Results

What have we forgotten?

#### First:

Take in account the weight of particle:  $w_i$ 

$$Q_{n,x} = \sum w_i \cos(n\phi_i) = Q_n \cos(n\Psi_n)$$

weight  $w_i$  is linear to  $p_t$  up to 2 GeV/c, after equal to 2 GeV/c

# Results : $v_2$ vs $p_t$

New Results

First good results but work in progress!

ntroduction Unified Approach Elliptic Flow Results Conclusion

#### Conclusion

EPOS was created for **very high energy** with an application for multiple scattering

EPOS has good results at number of observables  $\rightarrow$  very high energy

ntroduction Unified Approach Elliptic Flow Results **Conclusion** 

#### Conclusion

EPOS was created for **very high energy** with an application for multiple scattering

EPOS has good results at number of observables  $\rightarrow$  very high energy

But : First Study at "low" energies ( $\sqrt{s} = 7.7$  GeV at  $\sqrt{s} = 62.4$  GeV) for  $v_2$ 

We obtain good results!

Maybe EPOS can also reproduce observables at less high energy

troduction Unified Approach Elliptic Flow Results **Conclusion** 

# Thanks you !!!

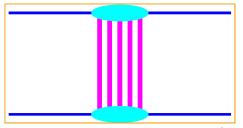

### Gribov-Regge Theory and Pomeron

Effective Field Theory

Elementary interaction → Pomeron exchange

Pomeron : Quantum numbers of vacuum

Vladimir Gribov in ≈ 1960

Elastic Amplitude :  $T(s,t) \approx is^{\alpha_0 + \alpha' t}$ 

### Hydrodynamic equations

Based on the four-momenta of string segments, we compute the energy momentum tensor and the flavor flow vector at some position x (at  $\tau = \tau_0$ ) as :

$$T^{\mu\nu} = \sum_{i} \frac{\delta p_{i}^{\mu} \delta p_{i}^{\nu}}{\delta p_{i}^{0}} g(x - x_{i})$$

$$N_q^{\mu}(x) = \sum_i \frac{\delta p_i^{\mu}}{\delta p_i^0} q_i g(x - x_i)$$

where q = u,d,s

arXiv:1312.1233v1 [nucl-th] 4 Dec 2013

**Initial Conditions :** PBGRT to initialize collisions, Pomerons treated by partons ladders after by Lund string

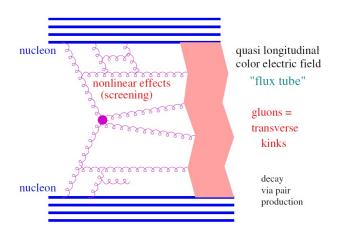

Core-Corona Approach Determine Jet and Quark Gluon Plasma

Viscous hydrodynamic expansion for the "core-matter"

Statistical Hadronization Procedure of Cooper-Frye

**Final state hadronic Cascade** Rescattering of products particle for the transport : UrQMD Model

**Initial conditions.** A Gribov-Regge multiple scattering approach is employed, where the elementary object (by definition called Pomeron) is a DGLAP parton ladder, using in addition a CGC motivated saturation scale for each Pomeron. The parton ladders are treated as classical relativistic (kinky) strings.

Core-corona approach. At some early proper time  $\tau_0$ , one separates fluid (core) and escaping hadrons, including jet hadrons (corona), based on the momenta and the density of string segments. The corresponding energy-momentum tensor of the core part is transformed into an equilibrium one, needed to start the hydrodynamical evolution. This is based on the hypothesis that equilibration happens rapidly and affects essentially the space components of the energy-momentum tensor.

Viscous hydrodynamic expansion. Starting from the initial proper time  $\tau_0$ , the core part of the system evolves according to the equations of relativistic viscous hydrodynamics. A cross-over equation-of-state is used, compatible with lattice QCD.

**Statistical hadronization.** The "core-matter" hadronizes on some hypersurface defined by a constant temperature  $T_H$ , where a so-called Cooper-Frye procedure is employed, using equilibrium hadron distributions.

**Final state hadronic cascade.** After hadronization, the hadron density is still big enough to allow hadron-hadron rescatterings. For this purpose, we use the UrQMD model.

We will present a "realistic" treatment of the hydrodynamic evolution of ultrarelativistic heavy ion collisions, based on the following features:

- initial conditions obtained from a flux tube approach (EPOS).
  - compatible with the string model used since many years for elementary collisions (electron-positron, proton proton),
  - and the color glass condensate picture;
- consideration of the possibility to have a (moderate) initial collective transverse flow:
- > event-by-event procedure,
  - taking into the account the highly irregular space structure of single events,
  - leading to so-called ridge structures in two-particle correlations;
- core-corona separation, considering the fact that only a part of the matter thermalizes;
