

*Detector Performance, including
Particle Flow Algorithm (PFA)*

Satoru Yamashita
University of Tokyo

Brief introduction of
Simulation tools and Particle Flow Algorithm

- 
1. Performance requirements
 2. Tools to optimize detector design and performance
 1. Physics benchmark, and Generators
 2. Detector simulators
 3. Particle Flow Algorithm
 1. Key techniques
 2. Examples of current results
 4. Summary

Many thanks to Akiya, Ties, Norman, Mark, Tamaki, Junpei,,,,,

For each detector performance, see concept study report tomorrow

Performance Goal of ILC Detectors

The best summarized in World-wide “Linear Collider Detector R&D”

J.Brau et al, <http://blueox.uoregon.edu/~lc/randd.ps>

■ VXT: quark flavor tagging - Key for Higgs/top and many physics

Impact Parameter resolution: $\sim 5\mu\text{m} + 10\mu\text{m} / p(\text{GeV}) \sin^{-3/2} \theta$

■ Tracker: Higgs recoil, resonances

Momentum resolution: $d p/p \sim 5 \times 10^{-5} \times p(\text{GeV})$ (central region)
 $3 \times 10^{-4} \times p(\text{GeV})$ for forward region

Angular resolution: $d\theta \sim 2 \times 10^{-5}$ rad (for $|\cos\theta| < 0.99$)

■ For Higgs, SUSY, etc..

Jet energy resolution: $dE/E \sim 0.3 / \sqrt{E(\text{GeV})}$

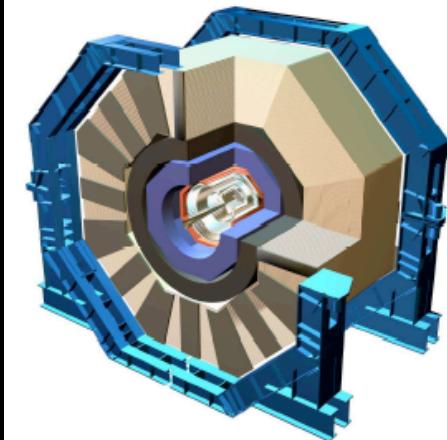

■ For background veto, missing energy physics

Excellent Hermeticity: down to $\theta \sim 5\text{--}10$ mrad (active mask)

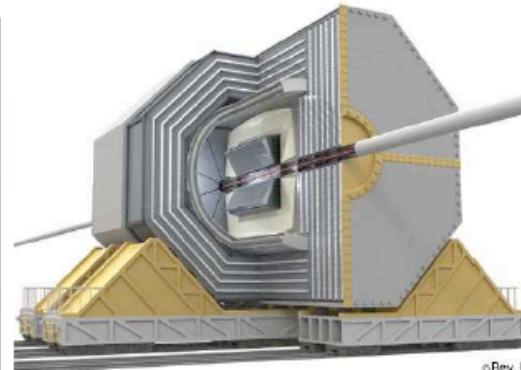

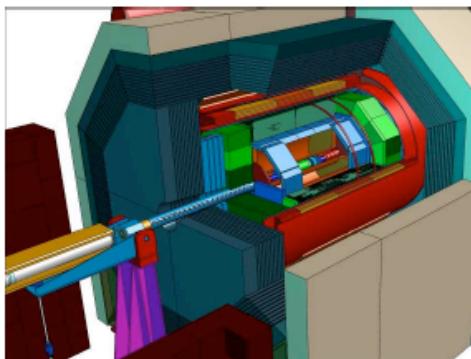

ILC Detector Challenges

With respect to detectors at LHC:

■ Inner VTX layer	3--6 times closer to IP
■ VTX pixel size	1 / 30
■ VTX materials	1 / 30
■ Materials in Tracker	1 / 6
■ Track mom. resolution	1 / 10
■ EM cal granularity	1 / 200 !!

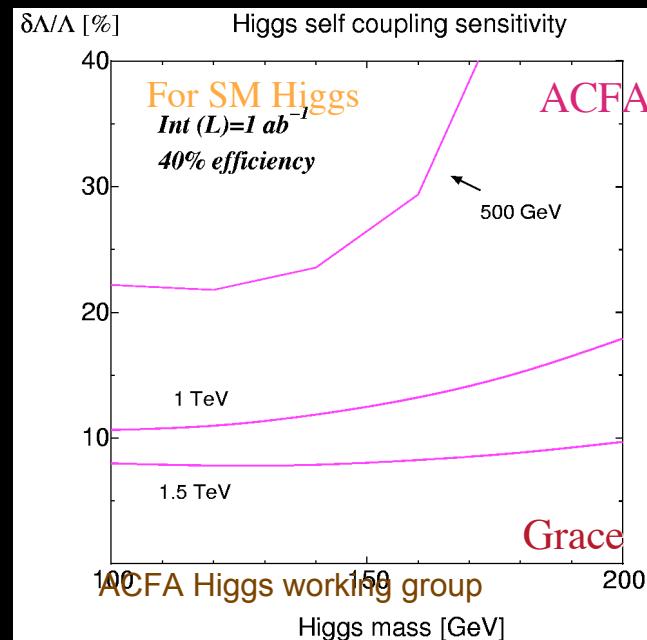

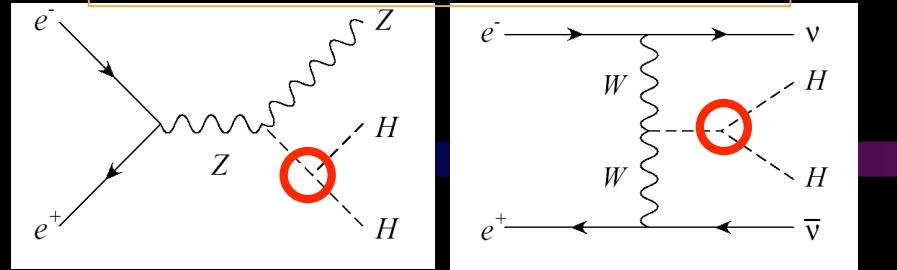

09.

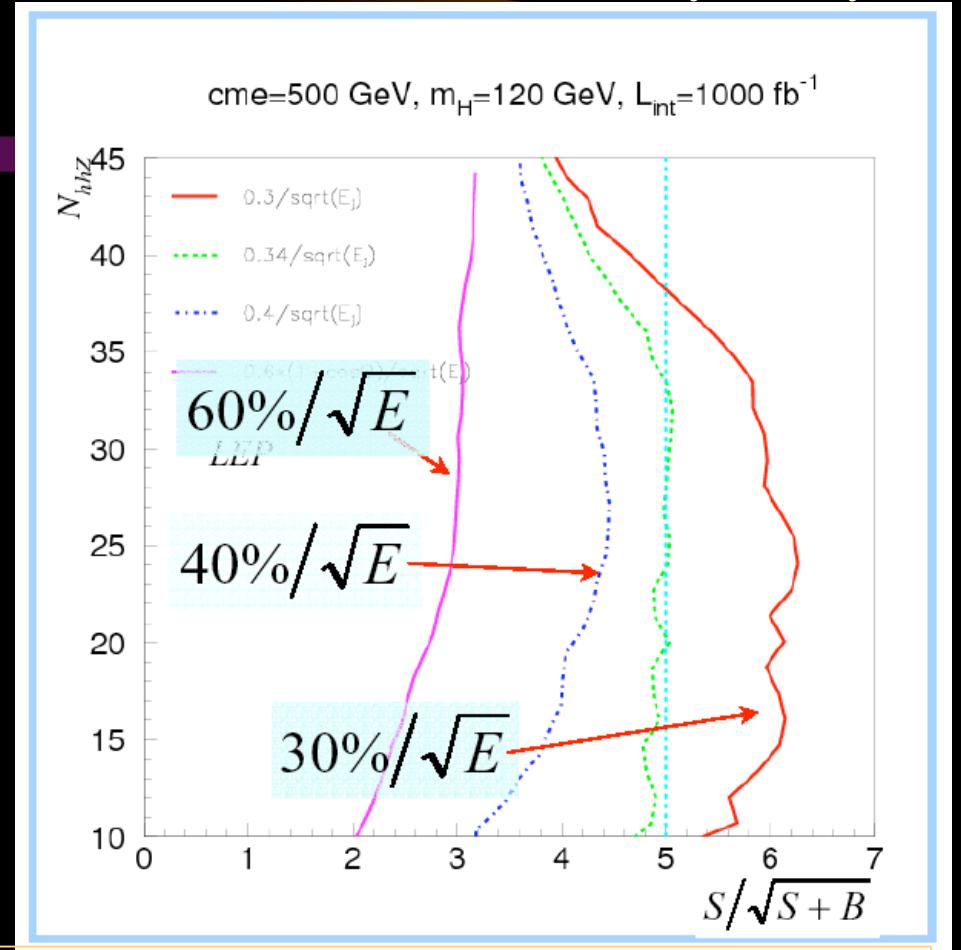

3

Jet energy resolution is a Key for multi-jets events @ ILC

Higgs self-coupling study

ECFA study - P.Gay et al

60%-->30% improvements is equivalent to
improving the ILC luminosity by factor 4~5 !!

Fast Simulation

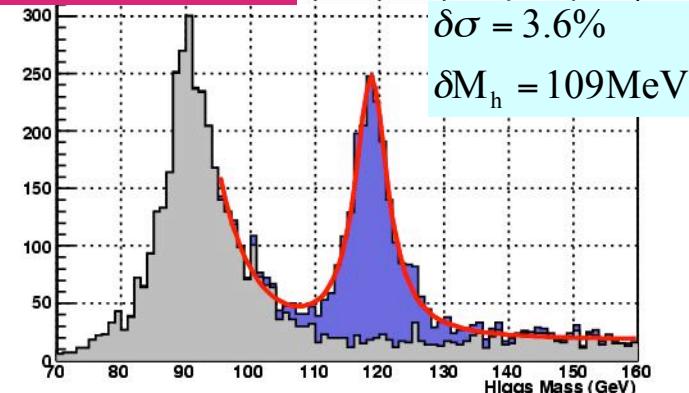

$e^+e^- \rightarrow HZ \rightarrow 2\text{jets} + \nu\nu$

T.Yoshioka et al

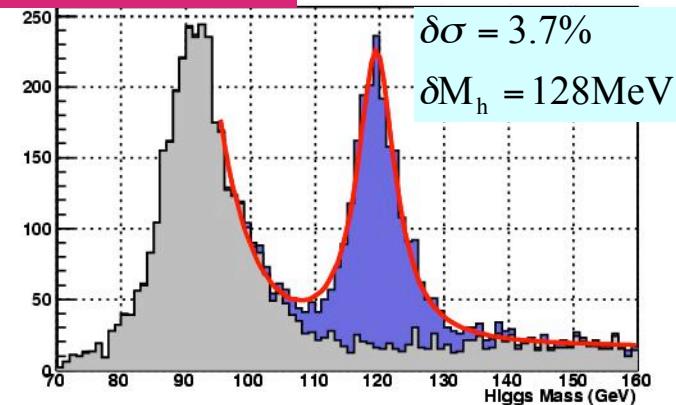

$e^+e^- \rightarrow HZ \rightarrow 4\text{jets}$

Without Kinematic-fit

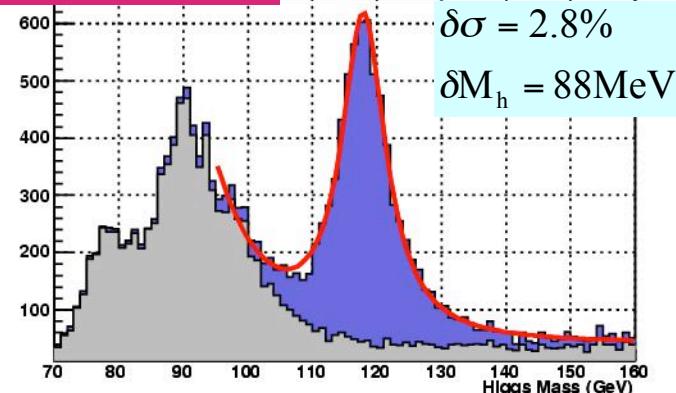

2jet, 30%/ \sqrt{E}

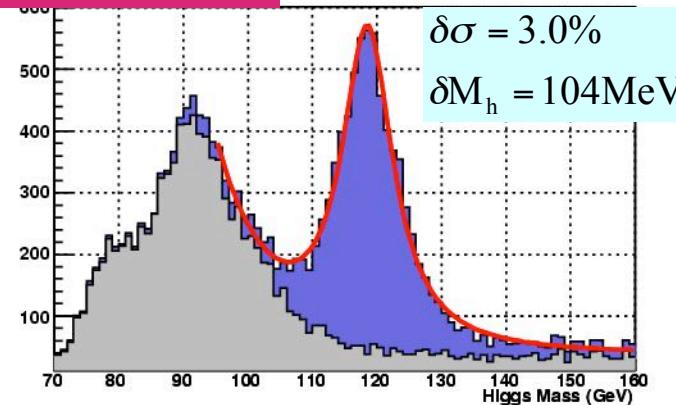

2jet, 40%/ \sqrt{E}

4jet, 30%/ \sqrt{E}

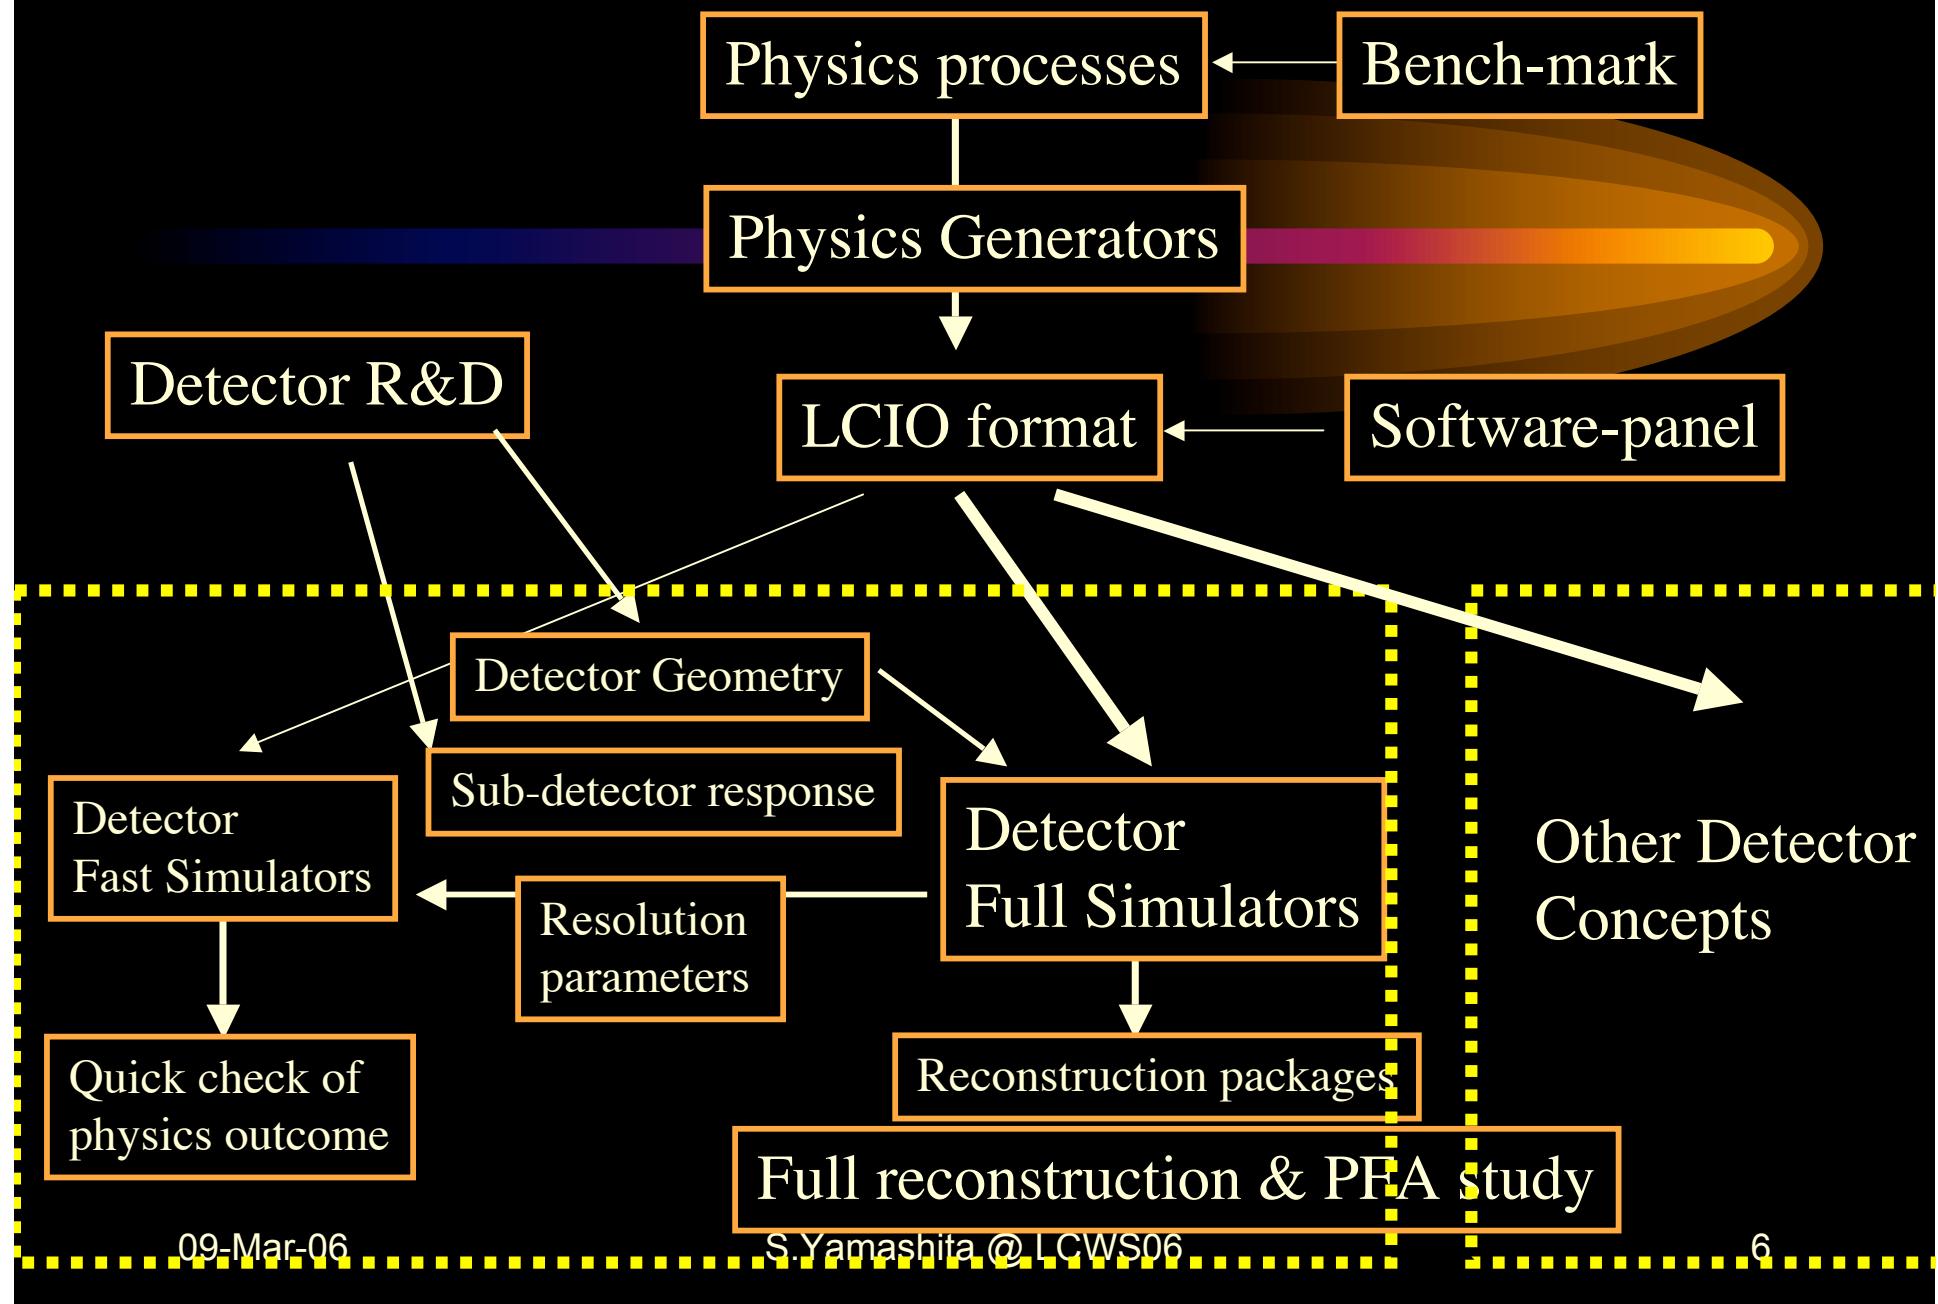

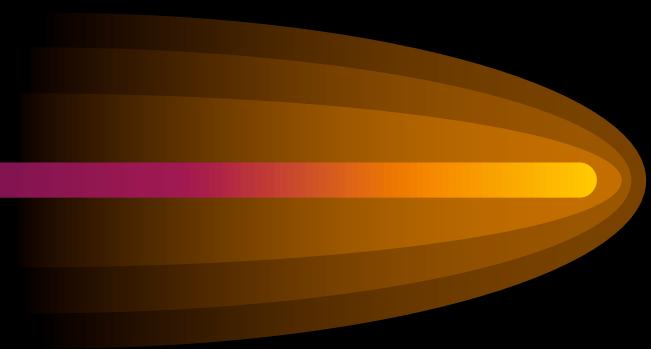

4jet, 40%/ \sqrt{E}

Small but significant difference between 30% and 40% resolution

Software tools to optimize detectors

- 
- Physics Benchmark
 - Generators
 - Detector Simulators
 - Reconstruction tools especially PFA

Physics Benchmark

Benchmark panel:

T.Barklow, M.Battaglia, Y.Okada, M.Peskin, S.Yamashita, P.Zerwas

To help detector optimization

Process	Vertex	Tracking	Calorimetry	Fwd	Very Fwd	Integration				Pol.			
	σ_{IP}	$\delta p/p^2$	ϵ	δE	$\delta\theta, \delta\phi$	Trk	Cal	θ_{min}^ν	δE_{jet}	M_{jj}	$\ell\text{-Id}$	$V^0\text{-Id}$	$Q_{jet/vtx}$
$ee \rightarrow Zh \rightarrow \ell\ell X$	x	x	x			x			x	x	x

$ee \rightarrow KK \rightarrow f\bar{f}$		x											
$ee \rightarrow ee_{fwd}$													
$ee \rightarrow Z\gamma$													

Chosen Characteristic benchmark channels

1. Single Particle, Jet-pair
2. Multi-Jets environments (PFA study etc..)
3. Flavor tagging and tau-ID
4. Small visible energy case (Forward area)

0. Single $e^\pm, \mu^\pm, \pi^\pm, \pi^0, K^\pm, K_s^0, \gamma, u, s, c, b; 0 < |\cos\theta| < 1, 0 < p < 500 \text{ GeV}$
1. $e^+e^- \rightarrow f\bar{f}, f = e, c, b$ at $\sqrt{s}=1.0 \text{ TeV};$
2. $e^+e^- \rightarrow Zh, \rightarrow \ell^+\ell^- X, m_h = 120 \text{ GeV}$ at $\sqrt{s}=0.35 \text{ TeV};$
3. $e^+e^- \rightarrow Zh, h \rightarrow c\bar{c}, \tau^+\tau^-, WW^*, m_h = 120 \text{ GeV}$ at $\sqrt{s}=0.35 \text{ TeV};$
4. $e^+e^- \rightarrow Zh h, m_h = 120 \text{ GeV}$ at $\sqrt{s}=0.5 \text{ TeV};$
5. $e^+e^- \rightarrow \tilde{e}_R \tilde{e}_R$ at Point 1 at $\sqrt{s}=0.5 \text{ TeV};$
6. $e^+e^- \rightarrow \tilde{\tau}_1 \tilde{\tau}_1$, at Point 3 at $\sqrt{s}=0.5 \text{ TeV};$
7. $e^+e^- \rightarrow \chi_1^+ \chi_1^- / \chi_2^0 \chi_2^0$ at Point 5 at $\sqrt{s}=0.5 \text{ TeV};$

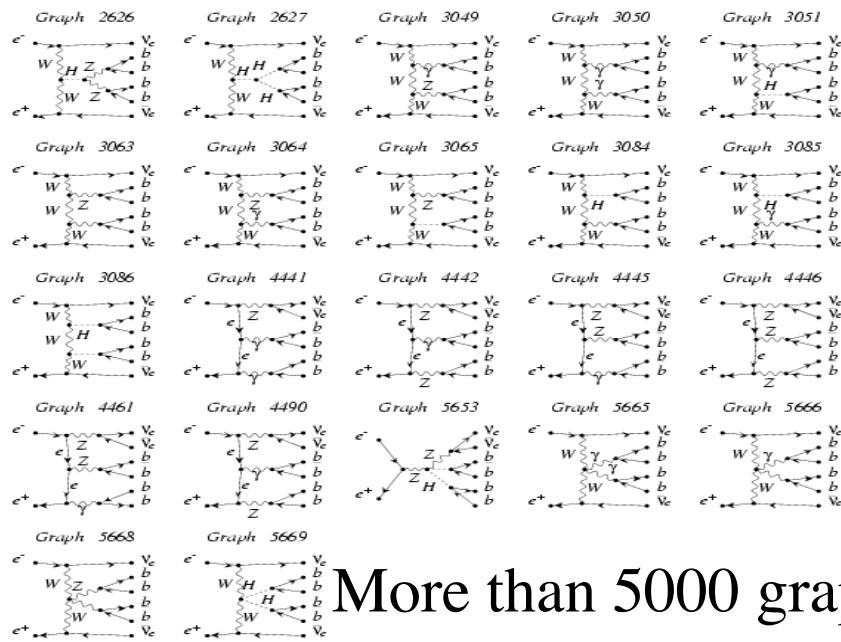

Event generators

Many generators under developments / available

ALPHA, COMPHEP, KORALW(GRACE inside), PYTHIA,
NEXTCALIBUR , WPHACT, WWGENPV,WTO, GRACE,
LUSIFER, WHIZARD, SIXFAP, PHEDAS,EETT6F, AMEGIC++,....,

Many diagrams must be calculated

Example: $e^+ e^- \rightarrow b\bar{b} b\bar{b} \nu_e \bar{\nu}_e$

WHIZARD Monte Carlo

All 0,2,4,6-fermion and
top quark (8-fermion processes).
500 fb⁻¹ @ 0.5 TeV all generated.

A news from GRACE

A new version of GRACE
grcft: much faster than old grc

More than 5000 graphs

CWCS06

Event Samples

From Norman. G

- Have generated canonical data samples and have processed them through full detector simulations.
- simple single particles: γ , μ , e , $\pi^{+/-}$, n , ...
- composite single particles: π^0 , ρ , K^0_S , τ , ψ
- Z Pole events: 30k/detector, 240,000 events
- WW, ZZ, tt, qq, tau pairs, mu pairs, Z γ , Zh: with beam pol
 - 10-30k/detector, 960,000 events
- Web accessible:

<http://www.lcsim.org/datasets/ftp.html>

Exiting amplitude using GRACE/grcft

processes	# of graphs	Accelerataed factor to old GRACE
$e^+ e^- \rightarrow (e^+ e^-)^2$	654	3.60
$e^+ e^- \rightarrow (e^+ e^-)^3$	145128	83.70
$e^+ e^- \rightarrow e^+ e^- \mu^+ \mu^- \tau^+ \tau^-$	12094	15.14
$e^+ e^- \rightarrow e^+ e^- \mu^+ \mu^- \tau^+ \tau^- \gamma$	117680	142.86

Kinematics is complicated to construct a realistic generator.
→ we need further study.

Plan: systematic study of
tree level : $e^+ e^- \rightarrow 7, 8$: 1-loop effects for $e^+ e^- \rightarrow 4f$

- **MSSM**
 $e^+ e^- \rightarrow 2, 3$;
SUSY23(23 processes)
SPA scheme should be introduced.
1-loop effects should be discussed. → see Yasui's talk

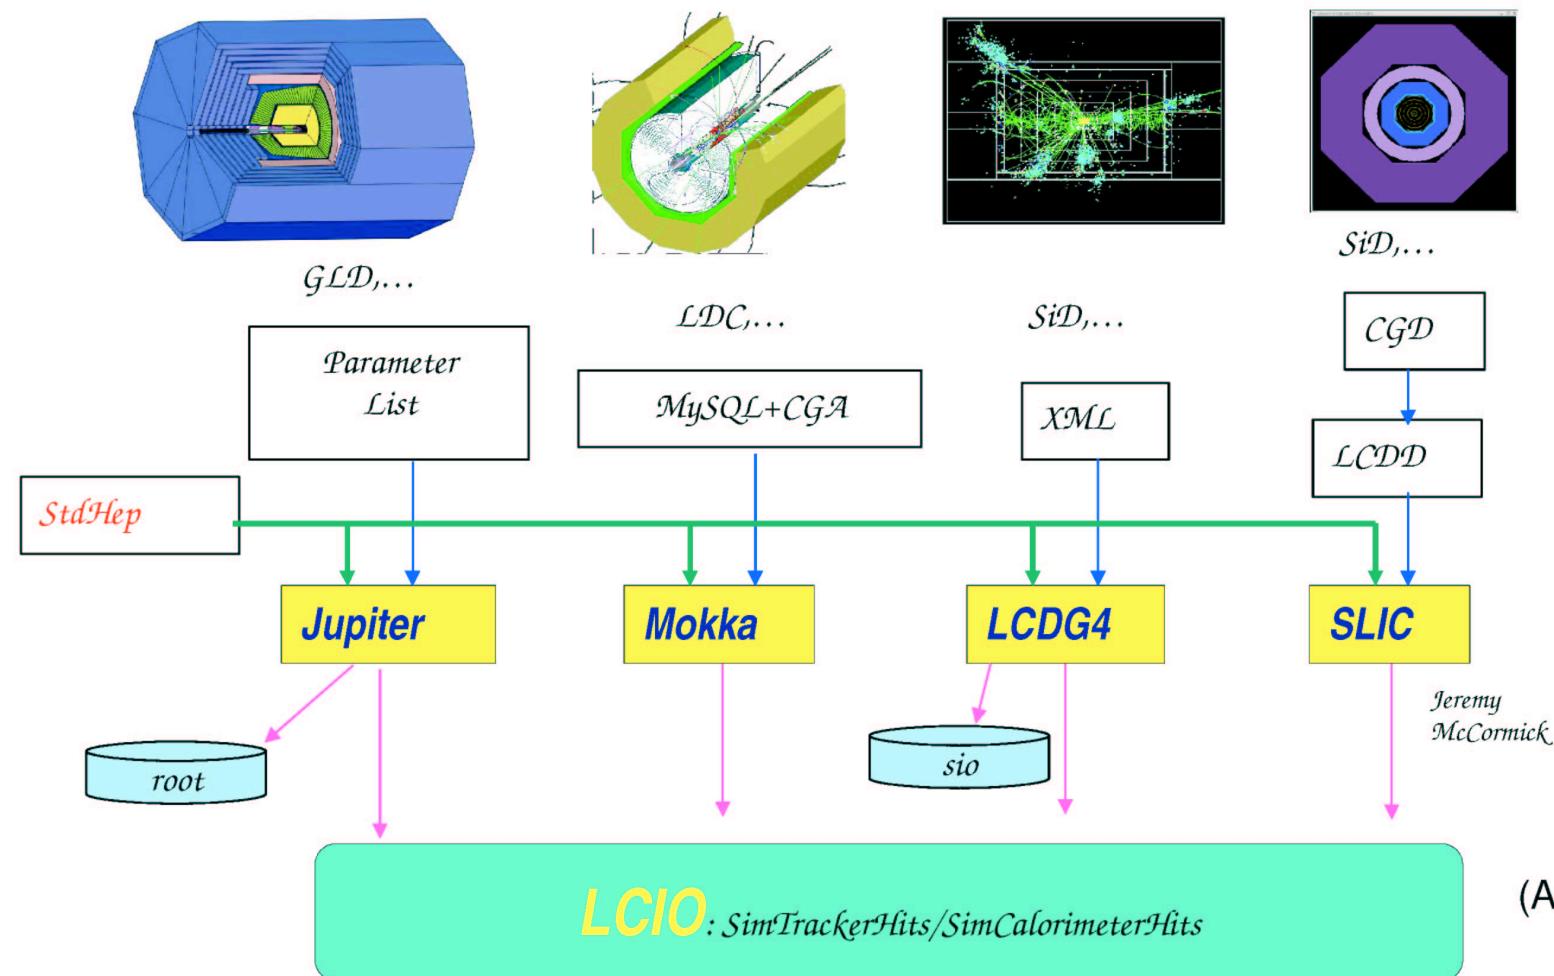

Software / frameworks for Detector Performance study

	Usage	Detector (birth)	Language	I/O-format
Simdet	fast MC	Tesla TDR	Fortran	StdHep/LCIO
JSF-Quicksim	fast MC	ACFA study / GLD	C++	LCIO / internal
SGV	fast MC	flexible	Fortran	(LCIO)

Many are under developments and many others as well.

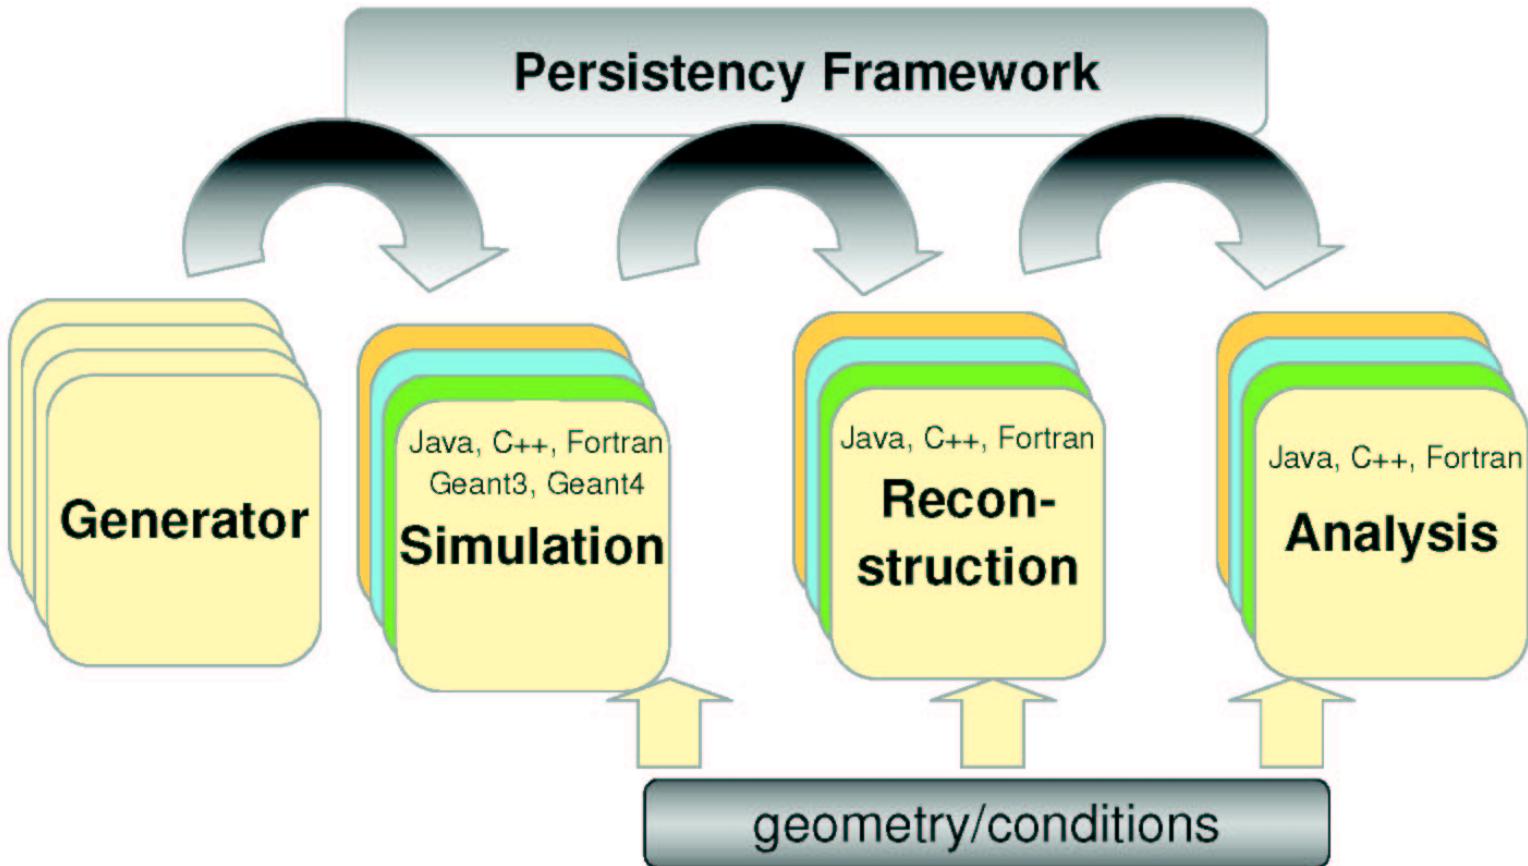

ILC Simulation Frameworks (Geant4)

- *Geant4*, *StdHep* and *LCIO* are common feature
- Each trying to be generic with different approach
different ways to define geometries

ILC software chain

Frank Gaede, ECFA ILC Workshop, Vienna, Nov 14-17, 2005

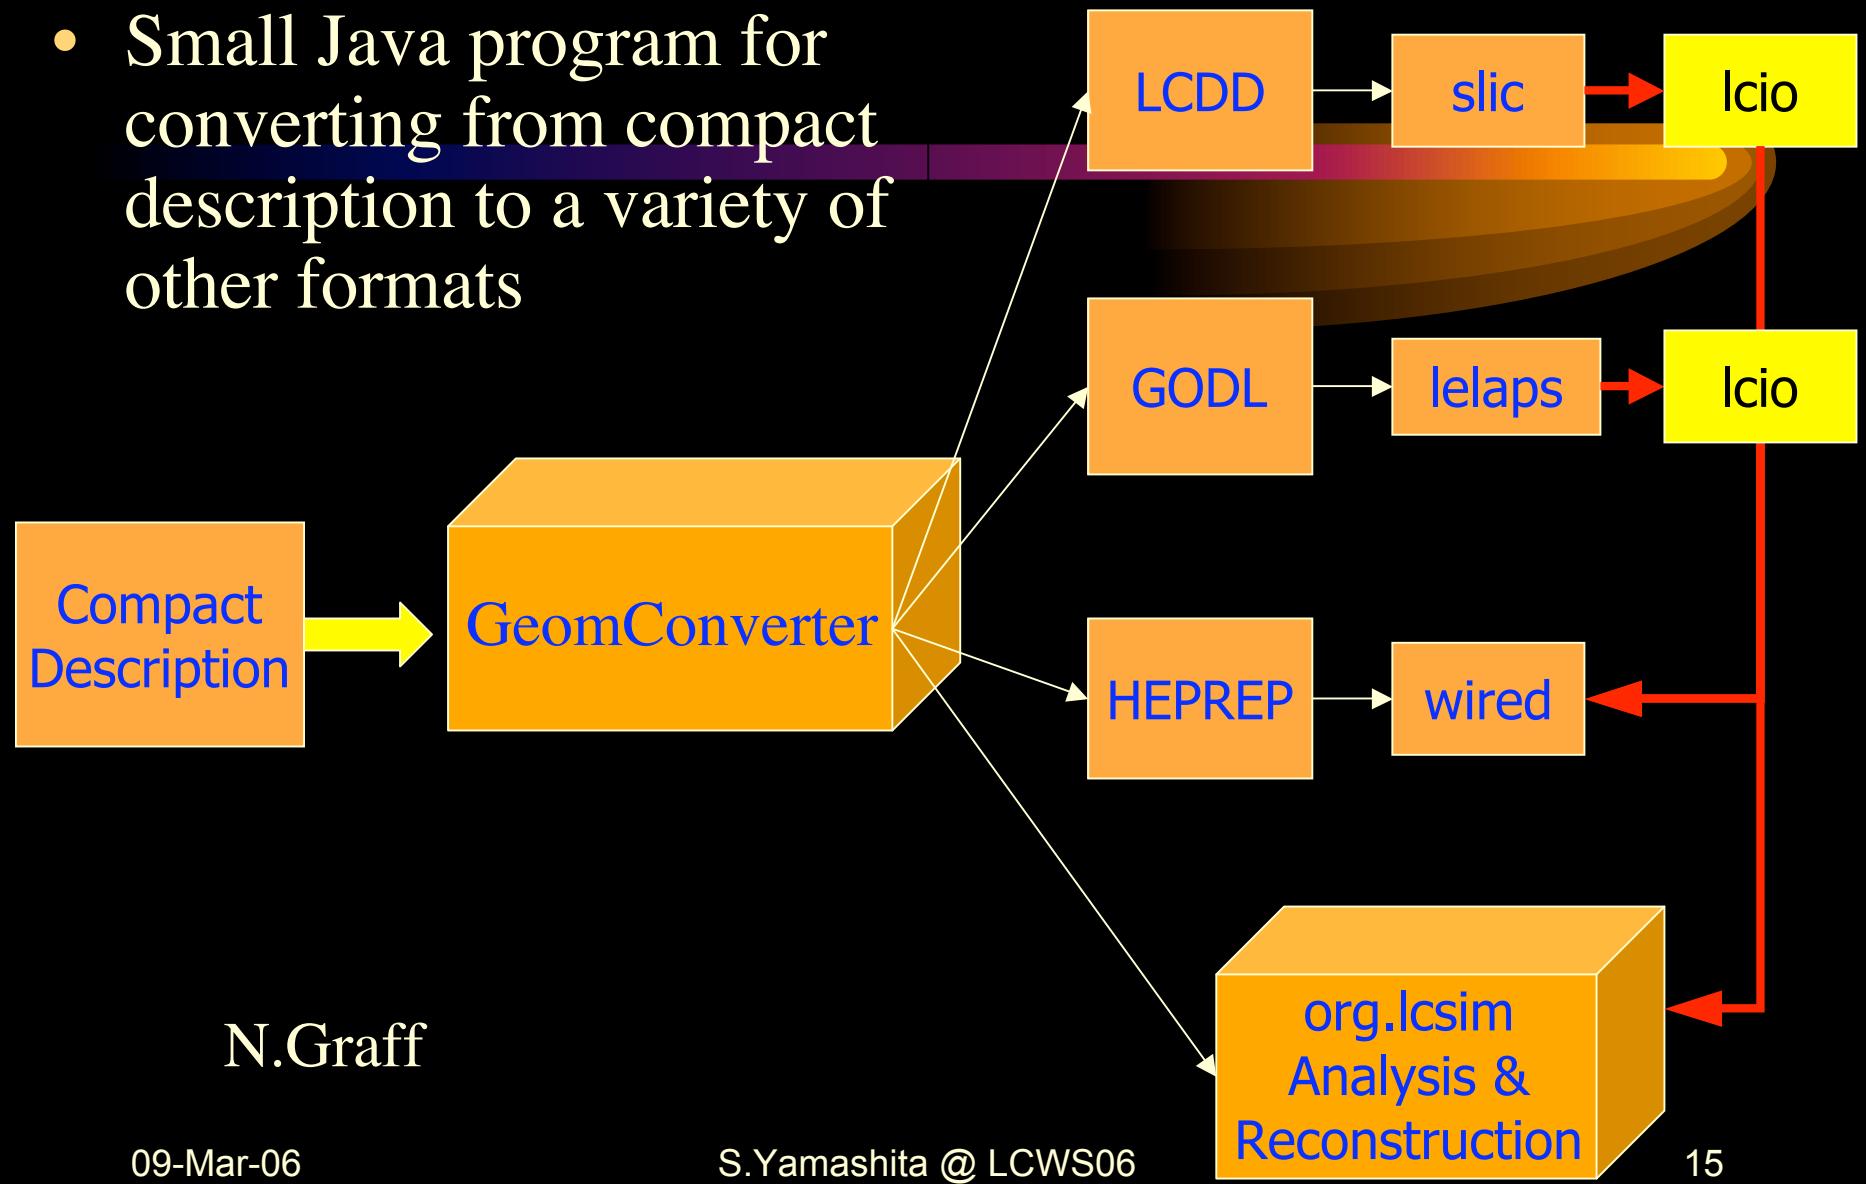

7

Example: Geometry Converter

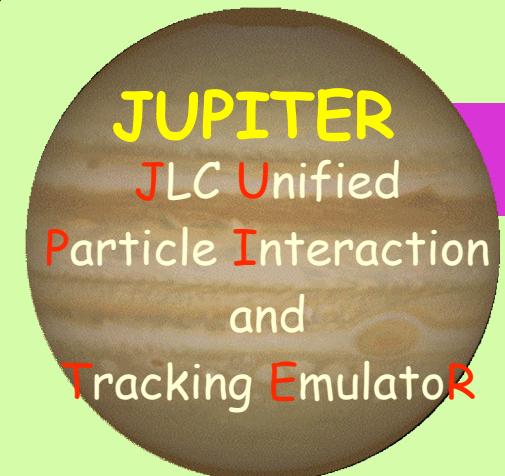

- Small Java program for converting from compact description to a variety of other formats

Framework

Event Reconstruction

JSF: the analysis flow controller based on ROOT: I/O=LCIO

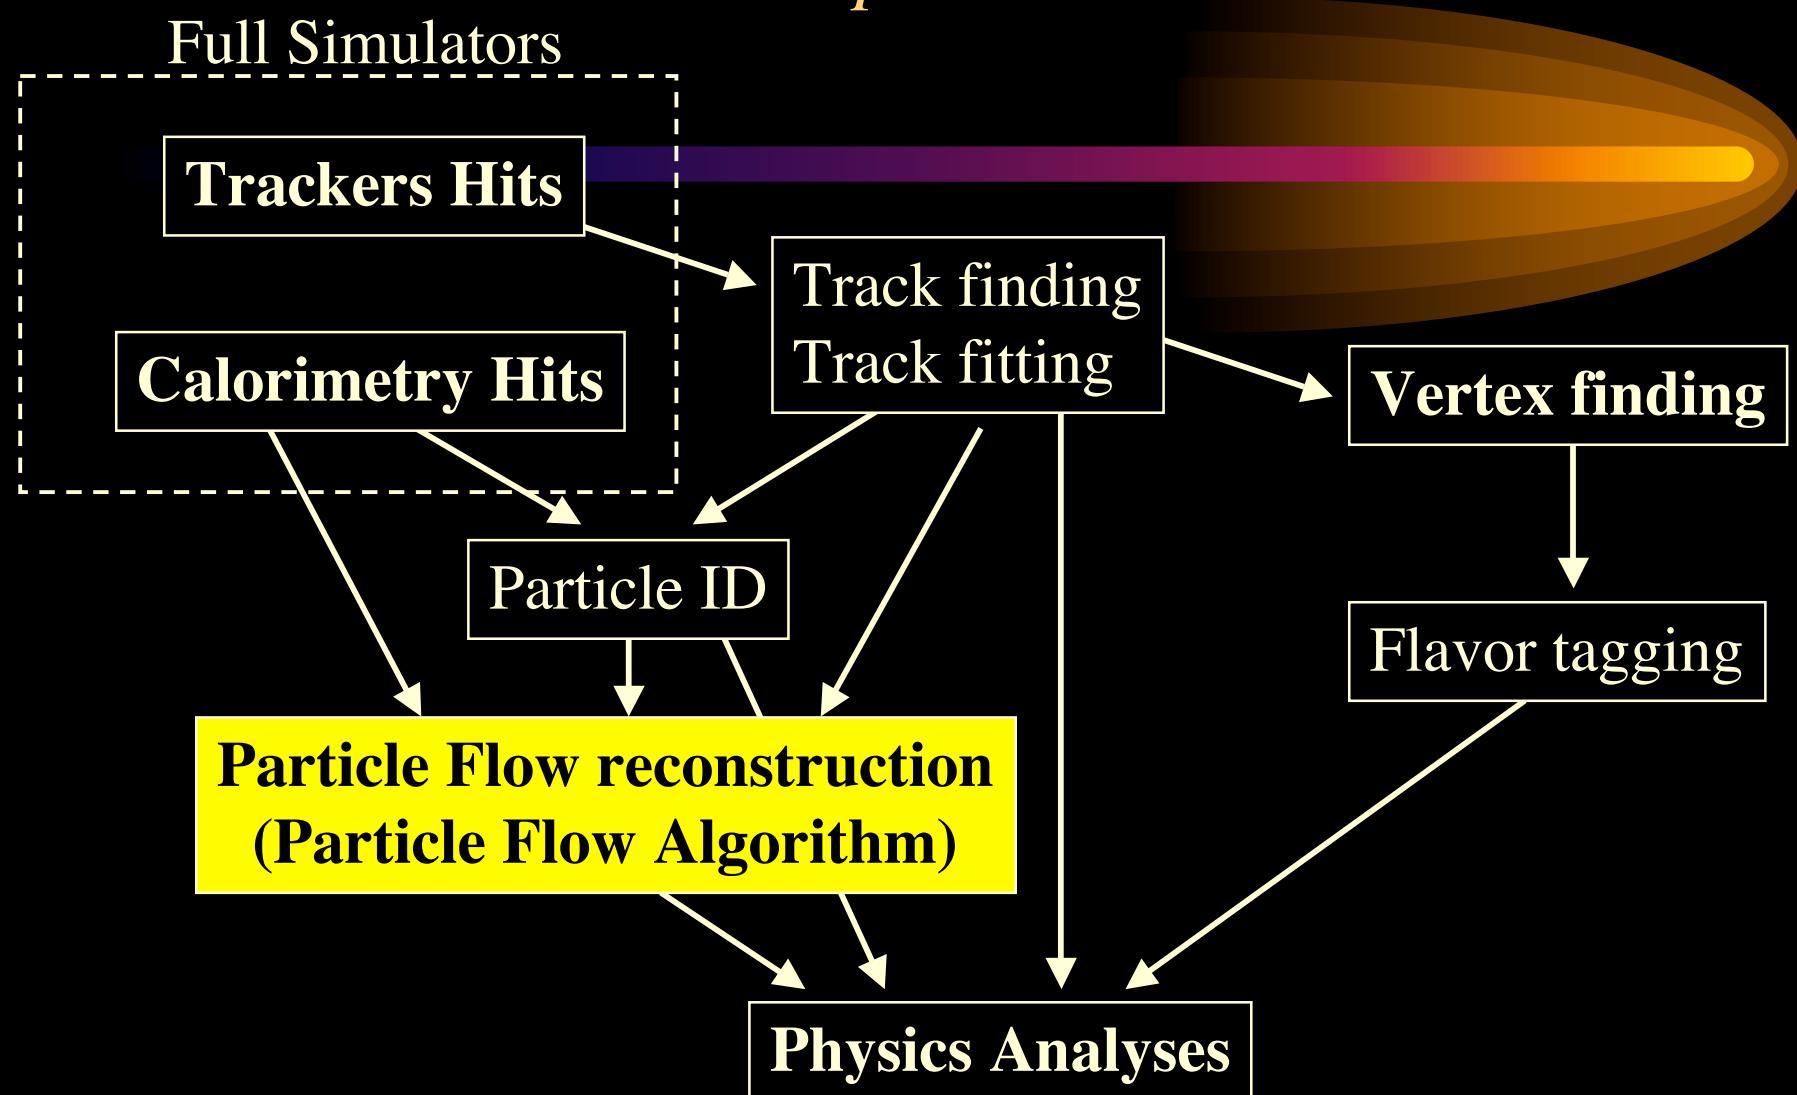

The package includes event generators, Quick Simulator,
and event display

Generators / Simulators are prepared...

Next step is the reconstruction

Full Simulators

Jet energy reconstruction

Typical event **30% electro-magnetic(γ)**, **70% hadronic**.

- Typical resolution: $\delta E/E = 10 \sim 15\% / \sqrt{E} (\text{GeV})$ for EM-CAL, $\delta E/E = 40 \sim 60\% / \sqrt{E}$ for Hadron-CAL

Ultimate resolution only with Calorimeters

$\delta E/E = \sim 45\% / \sqrt{E} (\text{GeV})$ (perfect calibration case)

Particle Flow Algorithm (Energy flow): widely used at LEP.

-- powerful & simple philosophy, but not easy technically.

- 70% hadronic \sim **60% charged hadron** + 10% neutral hadron
- Tracker's resolution is much better : $\delta P/P = 5 \times 10^{-5} \times P(\text{GeV})$
- Try to remove CAL-hits caused by charged hadron and use tracker Energy instead: (Technical challenge).

*“Perfect (*cheated*) PFA” to know the ultimate performance*

- Full simulation
- Sub-detector (CAL/Trackers) resolution same as reality.
- **Perfect Track - CAL association** looking into MC info (cheating).

u,d,s quark pair Events at Z pole

Breakdown of Error Source

Neutrino 0.30 GeV

5mrad cut 0.62

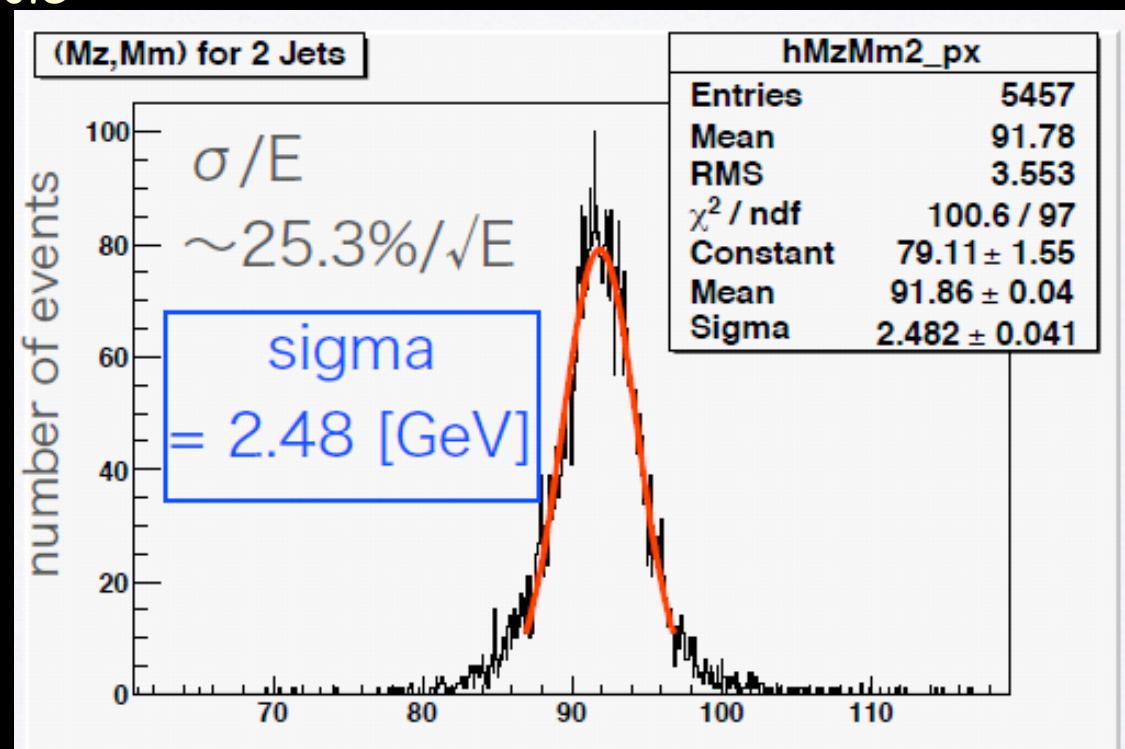

Low Pt track 0.83

Track Resol. 0.0

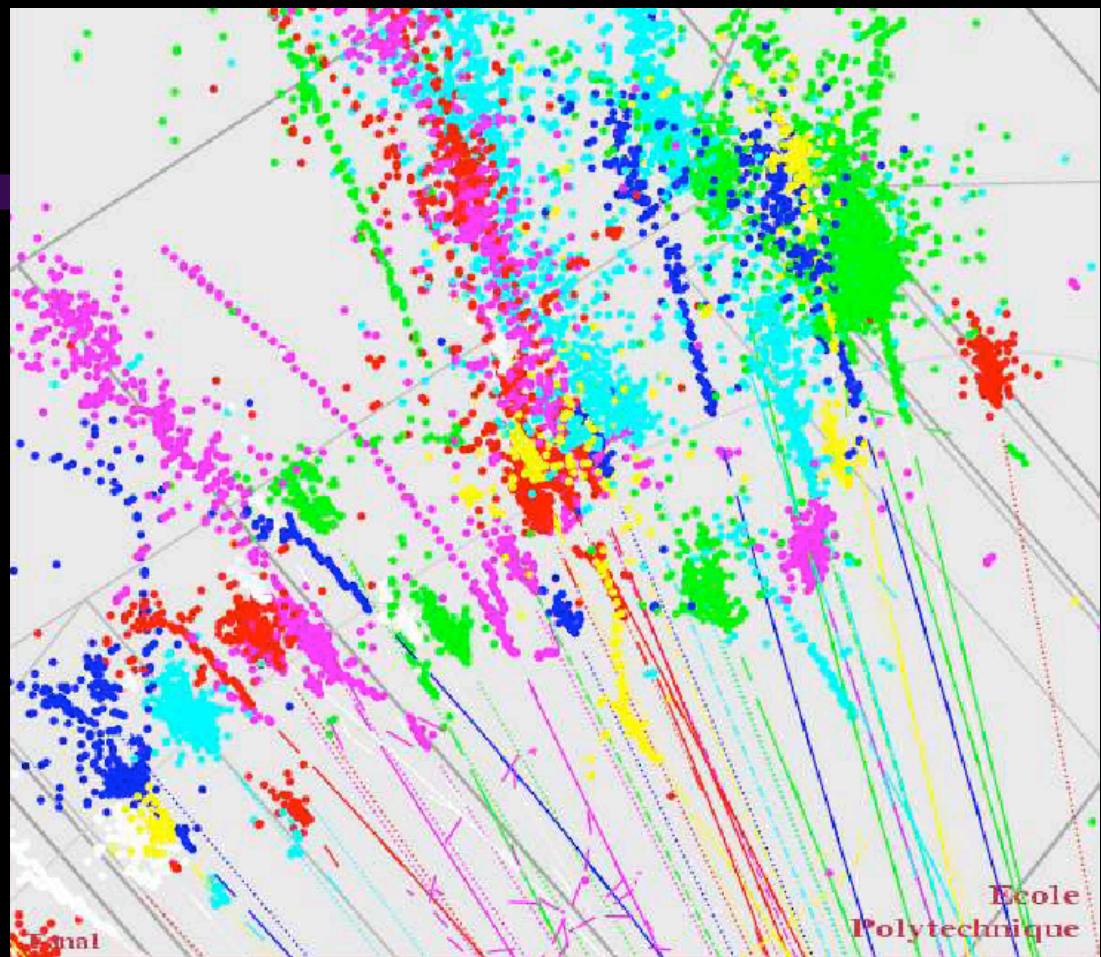

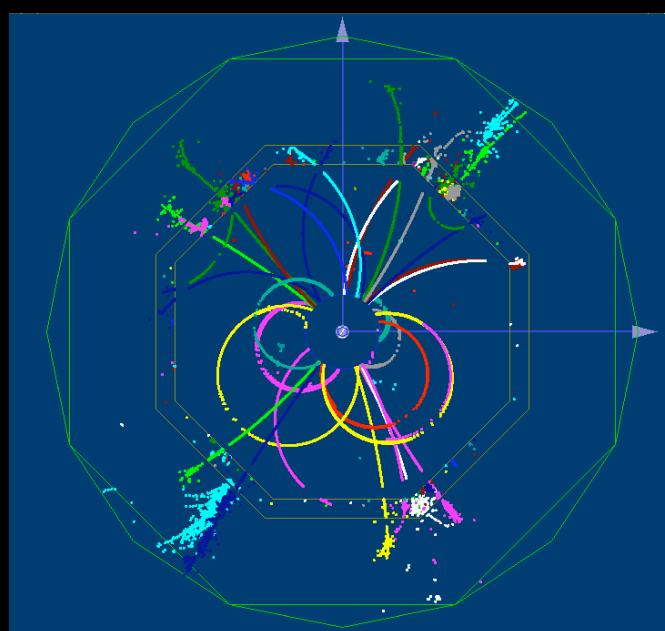

EM Cal Resol. 1.36

HD Cal Resol. 1.70

Total 2.48

Challenges of PFA in reality

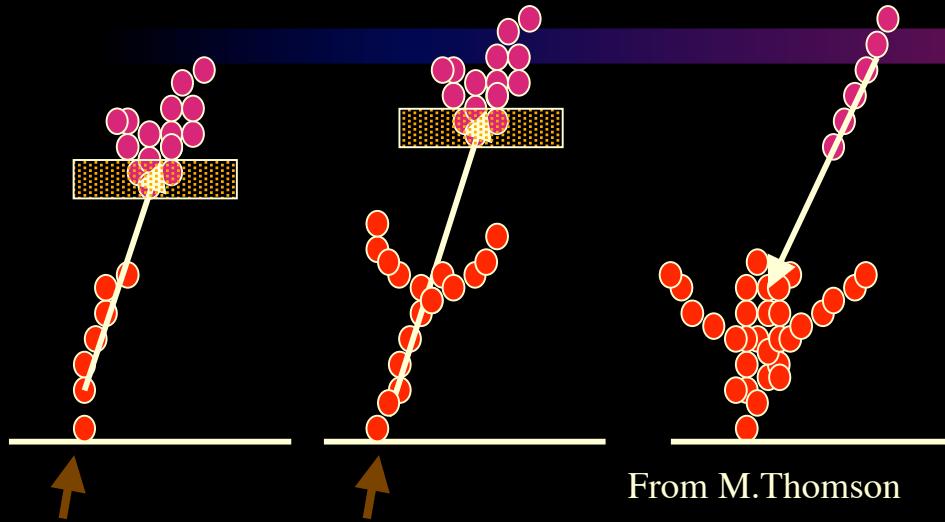

Track - CALhits association is not easy in real world...

PFA in reality

- From Detector Concepts
 - **How to reduce particle density in CAL to make track-CAL association easy? How to improve overlap of hits in CAL?**
 - --> High magnetic field and/or
 - --> Large volume detector and/or
 - --> High granularity (~must)
- Most important key is the pattern recognition (clustering/tracking) in EM CAL:
 - Very high hit density
 - Mixture of different particles (γ , h^+ , h^0) -- different calibration factors
- How to clusterize/connects hits (**clustering techniques**)
- How to discriminate γ and hadron in EM-CAL (**shower shape analyses**)
- How to remove satellite (daughter) clusters far from original tracks (**time analyses / shape analyses**)

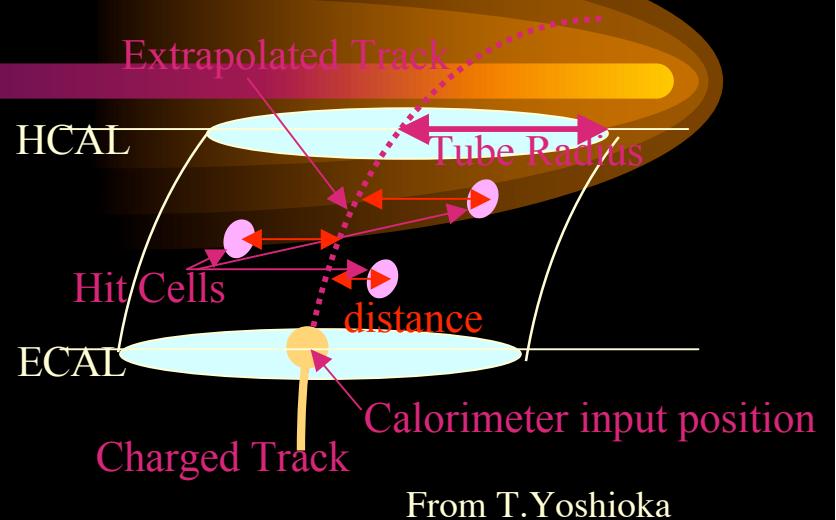

Two directions of PFA under developments

Full pattern recognition in CAL

- can be ~ultimate PFA
- Need to consider many patterns

Simple Track-hit association

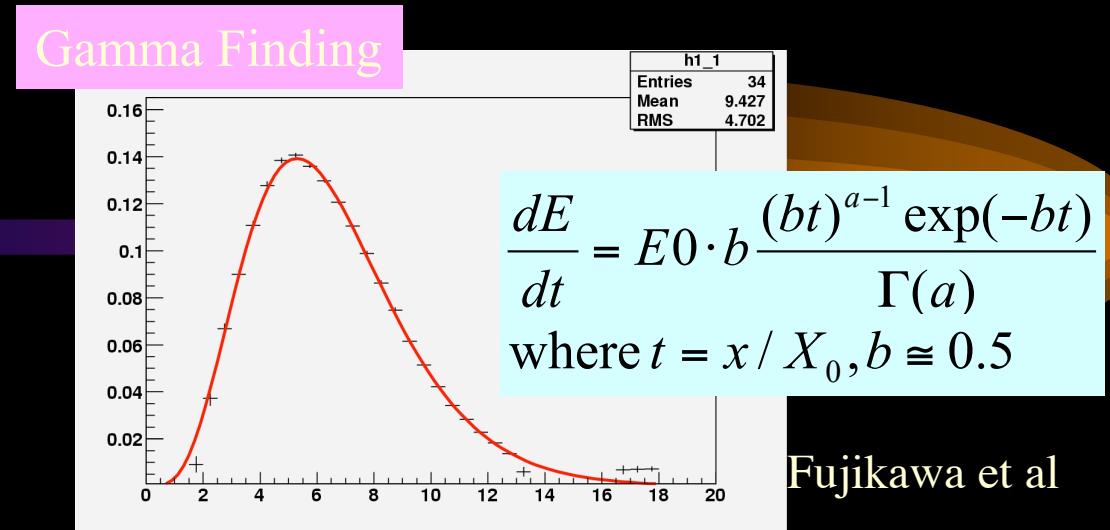

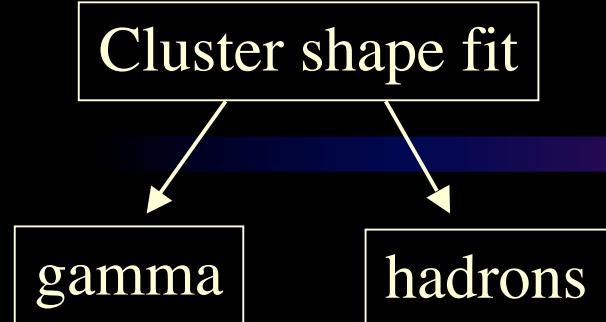

- Simple, fast and robust
- Weak for very high density case

Combination of these may be the best

What is suitable depends on detector configuration,
granularity, size, e/ π ratio (compensation type or not),,,

Example of shower shape analyses etc..

Other techniques

- MIP track finding in CAL
- Neutral cluster finding
- Satellite cluster rejection
- Reconstruction of π^0

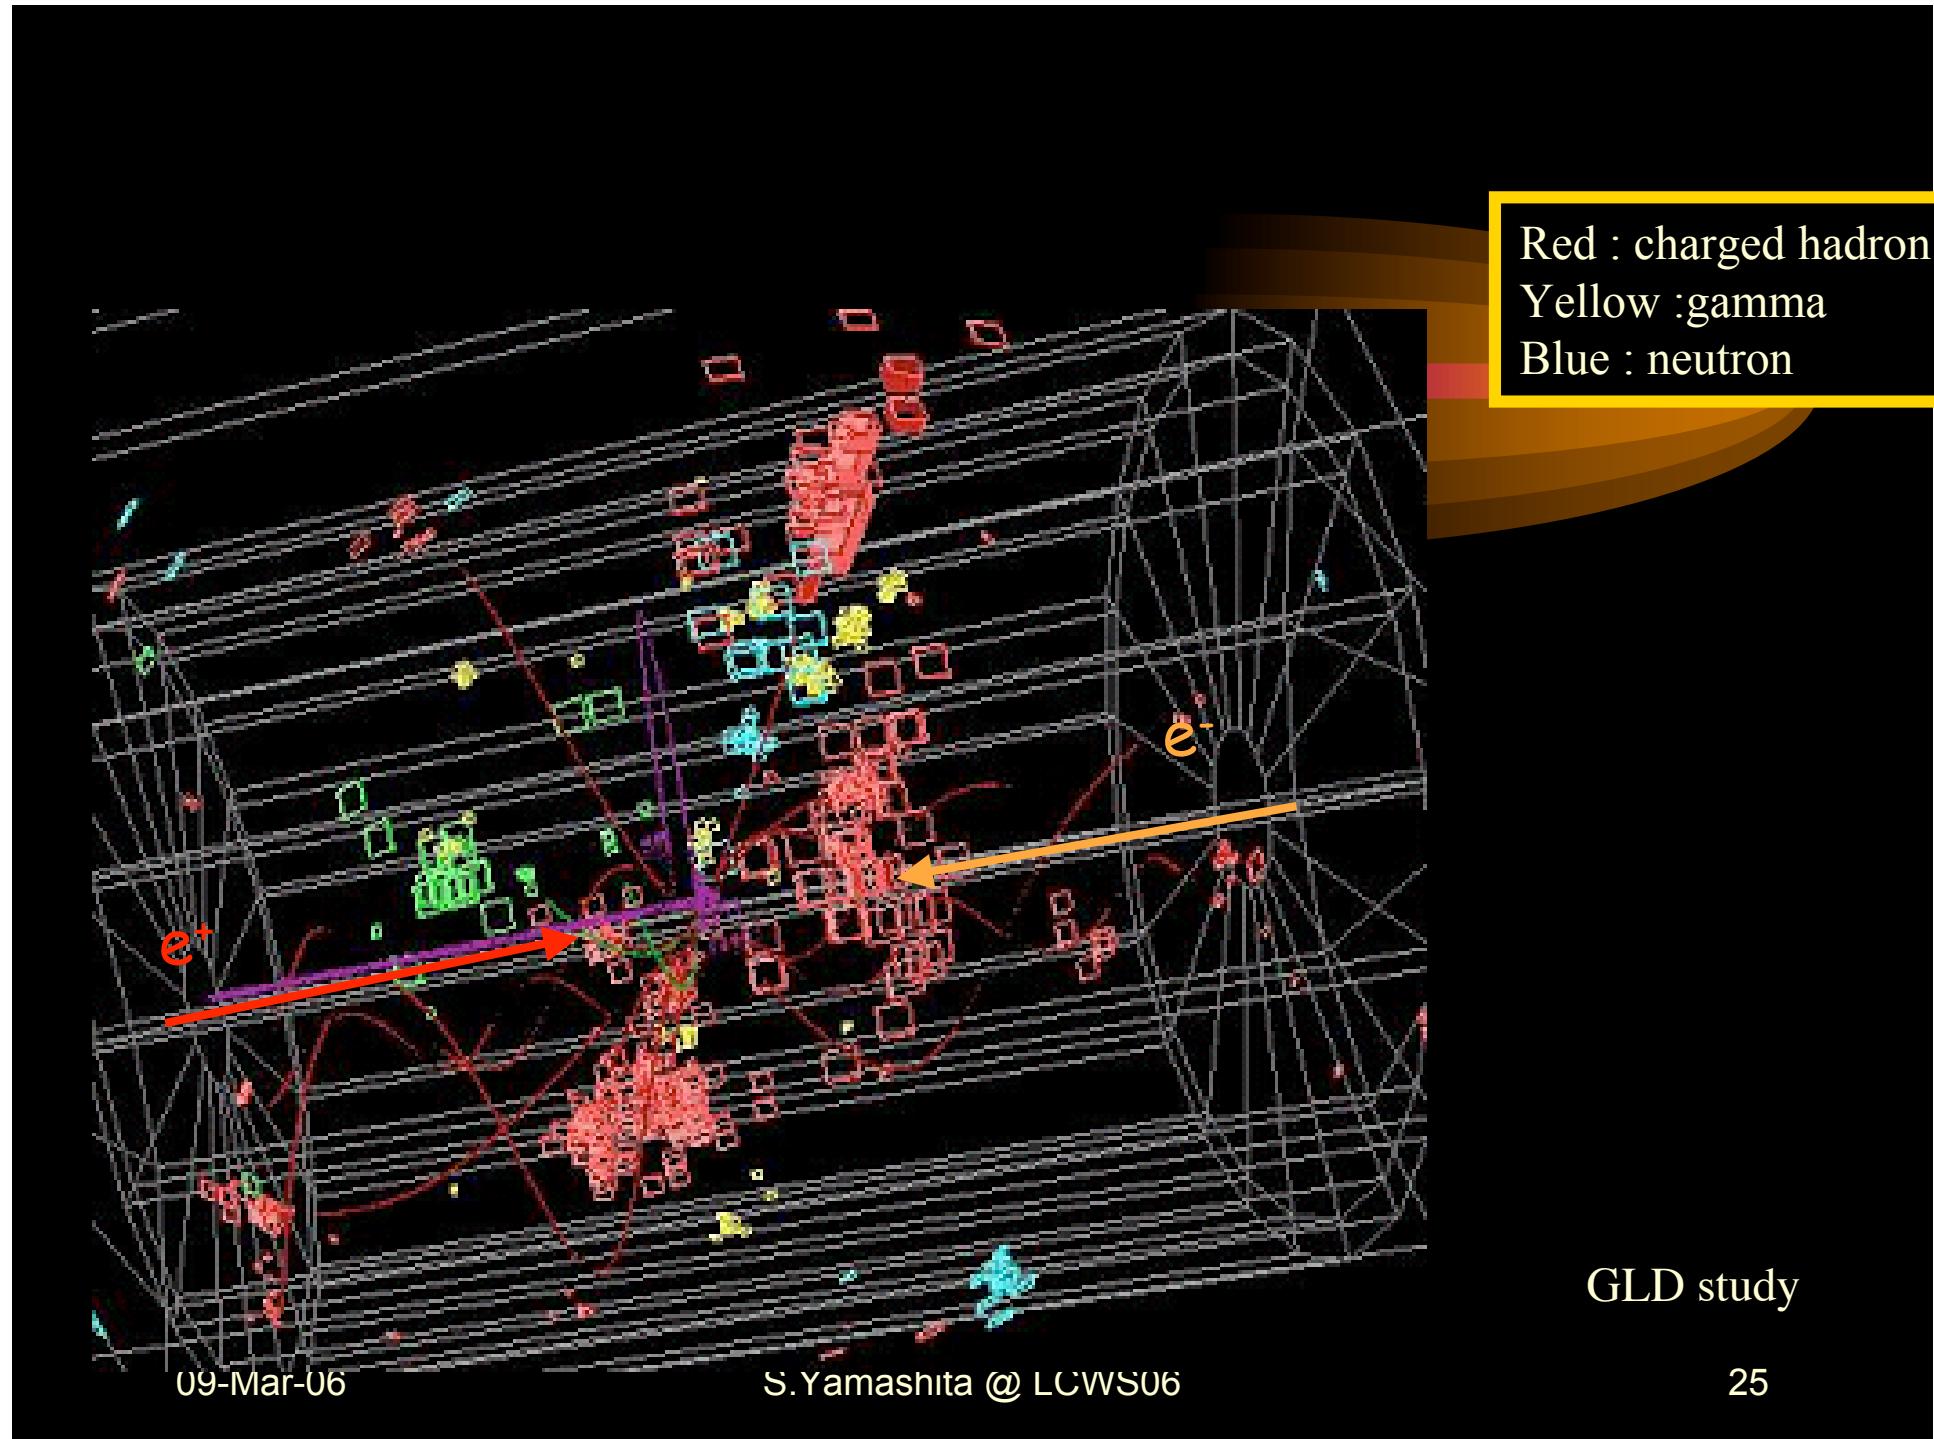

Many developments on going

Before PFA

Red : charged hadron
Yellow :gamma
Blue : neutron

After gamma
finding

Red : charged hadron
Yellow :gamma
Blue : neutron

After charged Hadron tagging

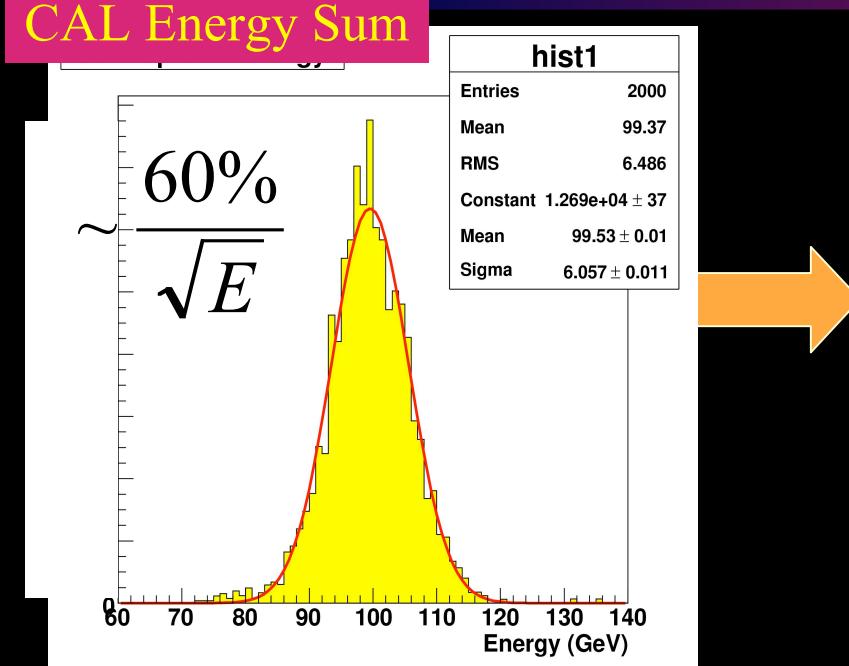

Majority of gamma's and charged hadrons are tagged properly

Example of PFA current result

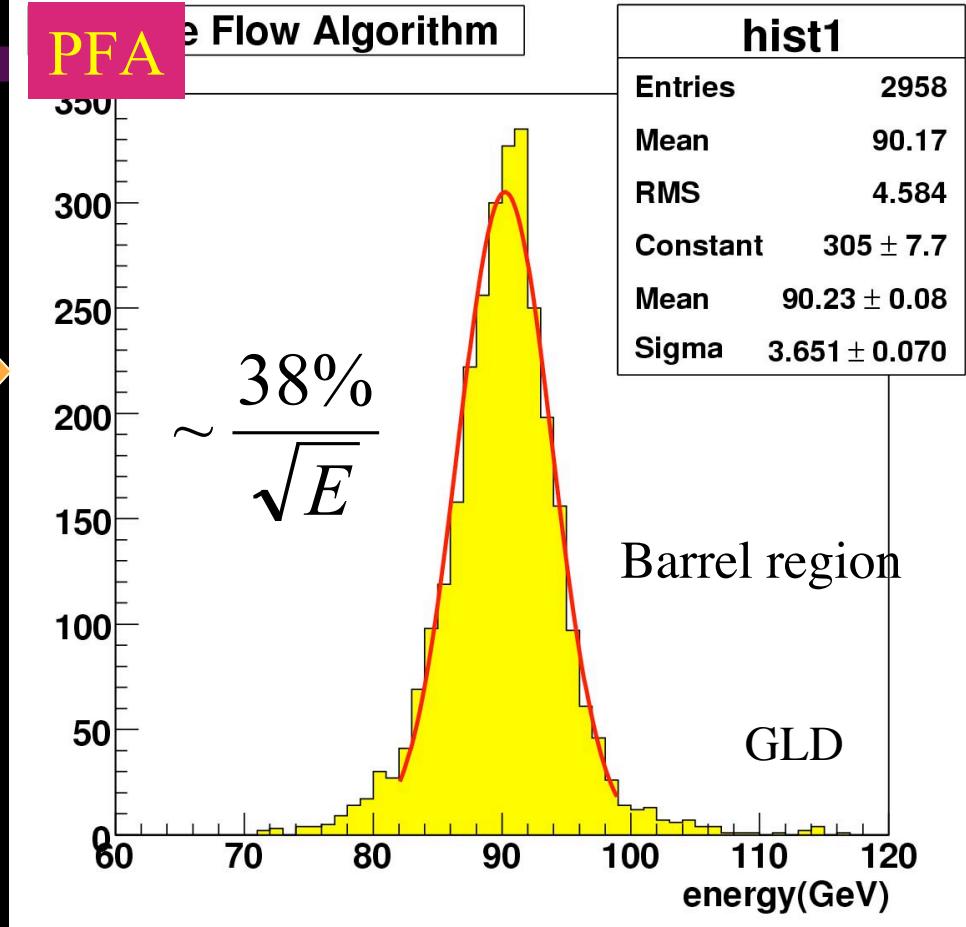

- $Z \rightarrow q\bar{q}$ @ 91.18GeV

T.Yoshioka et al

CAL Energy Sum

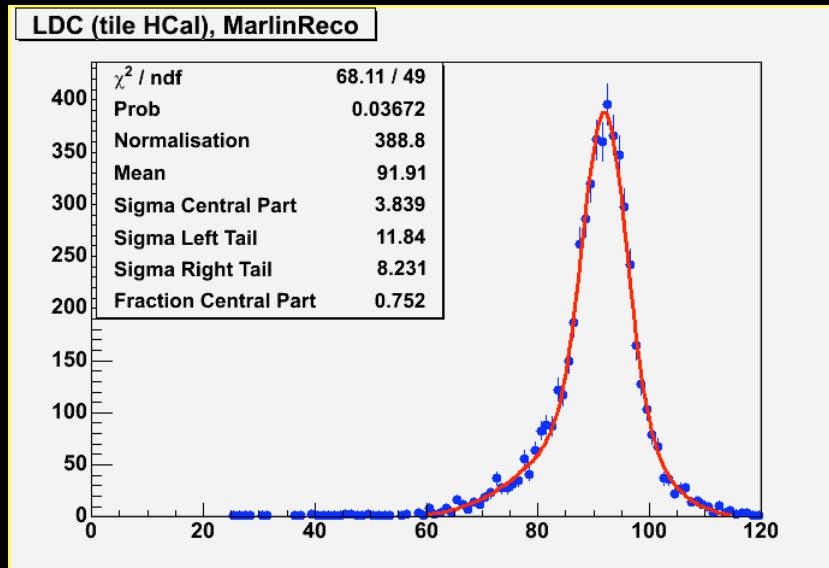

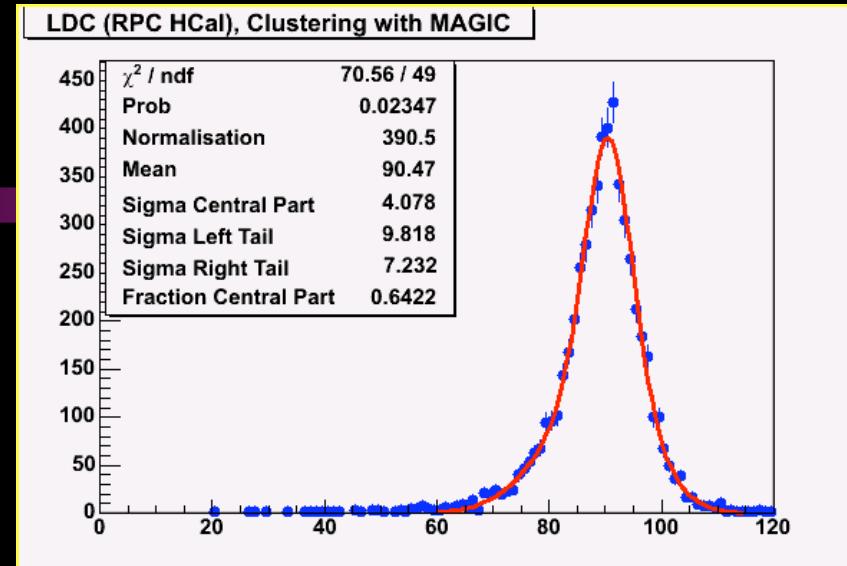

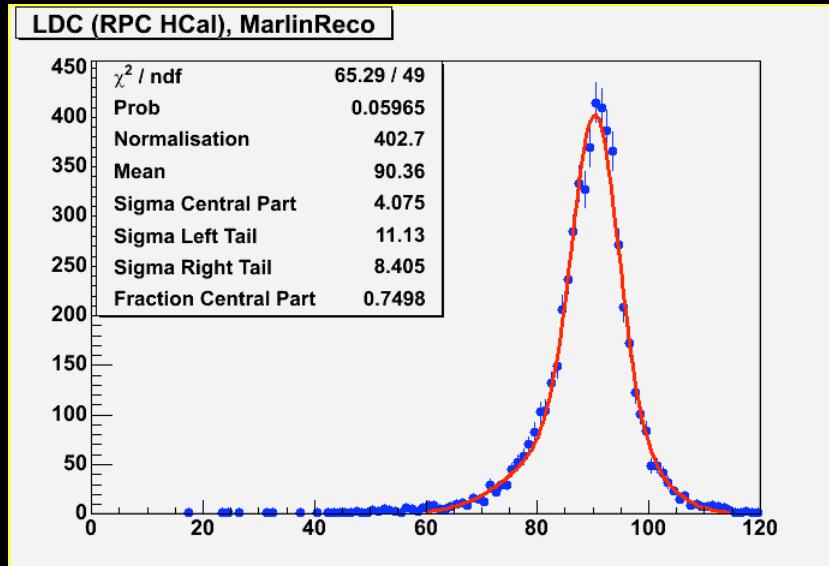

PFA
Particle Flow Algorithm

Note: Only for jets towards barrel region,
S.Yamashita @ andrews666
and effect of neutrino is removed. 29

Taken from M.Thomson's slides at ECFA study

WOLF Results ($Z \rightarrow uds$ jets)

★ RMS(90%)

- ★ Find smallest region containing 90 % of events
- ★ Determine rms in this region

	RMS (90%)
RPC HCAL	4.3 GeV
Tile HCAL	4.1 GeV
RPC (MAGIC)	4.4 GeV

Summary

- **Various software tools** (Generators, Simulators, reconstruction tools) have been prepared and extensively improved/developed. We are ready for full detector performance study such as PFA.
- **LCIO format** is commonly used for all concepts study, and inter-concepts developments for reconstruction tools have been started.
- Various method of **Particle Flow Algorithm for ILC** is under development. Philosophy is simple and widely used at LEP, but it's not technically straight-forward.
- (Ultimate goal is $\delta E/E \sim 25\%/\sqrt{E(\text{GeV})}$ and target is $30\%/\sqrt{E(\text{GeV})}$)
- Big activity is on-going world-wide for PFA, and nice and similar results have been obtained in different detector configuration with different algorithms.
- While there are still **many rooms for improvements**, current **PFA studies already achieved $\delta E/E < 40\%/\sqrt{E(\text{GeV})}$**
- **For each detector performance, let's watch the concept talks (tomorrow)**
