

# Compton based Polarized Positrons Source for ILC

**S.Roychowdhury**

On behalf of

**V.Yakimenko<sup>1</sup>, D.Cline<sup>2</sup>, I.V.Pogorelsky<sup>1</sup>, V.N.Litvinenko<sup>1</sup>**

**Linear Collider Workshop 2006**

**March 9 – March 13, 2006, Bangalore, India**

1. Brookhaven National Laboratory, NY, USA

2. University Of California at Los Angeles, CA, USA

3. Duke University, NC, USA

# Outline

- Review
  - Requirements (positron beam) for International Linear Collider
  - Proposal by Omori, et al
- ATF(BNL,NY) proposal
  - Introduce the proposal
  - Discuss parameter choice
  - Ring vs. Linac and stacking vs.no-stacking
- Laser System
- Experiment
  - ATF,BNL
  - KEK,Japan
- Conclusions

# ILC Source Requirements

| Parameter               | Symbol    | Value              | Unit  |
|-------------------------|-----------|--------------------|-------|
| Positrons per bunch     | $n_p$     | $2 \times 10^{10}$ | $e^+$ |
| Bunches per pulse       | $N_b$     | 2820               |       |
| Bunch Spacing*          | $t_b$     | ~300               | ns    |
| Pulse rep. rate         | $f_{rep}$ | 5                  | Hz    |
| Energy                  | $E_0$     | 5                  | GeV   |
| Positron Polarization** | $P_p$     | ~60                | %     |

\*Length of bunch train= $2820 \times 300(\text{ns}) = 0.85\text{ms} \sim 250\text{km}$

\*\*Conversion/capture efficiency for polarized gamma  $\longleftrightarrow$  polarized  $e^+$   
 60%  $\longleftrightarrow$  1.5%

# Polarized Positron Production

Compton Ring Scheme: CO<sub>2</sub> Version (Omori, et al.)

# Polarized Positrons Source (PPS for ILC)

ATF, BNL Proposal

## □ Polarized Gamma Ray Generated By

- Compton scattering inside optical cavity of CO<sub>2</sub> laser *with*
- 6 GeV electron beam produced by Linac
- Expected Efficiency  $N_{\gamma}/N_{e^{-}} \sim 10$

## □ Polarized Positron Beam Generated By

- Scattering 80 MeV  $\gamma$  ray on a thin target
- Capture Efficiency  $N_{e^{+}} / N_{\gamma} \sim 1.5\%$

# Merits of the Proposal

- ❑ Required intensities of polarized positrons obtained because
  - e-beam charge is sufficiently high(10 times compared to conventional non polarized source)
  - complex CO<sub>2</sub> laser system
- ❑ L-band type photo injector and linac for acceleration
  - No R&D required
- ❑ Laser system
  - commercially available lasers
  - R&D for the new mode of operation (described later)

# Choice of Parameters

$$N_{\bar{\gamma}} = \frac{N_e N_{\phi}}{S} \sigma_c$$

$N_e$  # of electrons,  $N_{\phi}$  # of laser photons

$N_{\gamma}$  # of gamma rays,  $S$  area of interacting beams

$\sigma_c$  Compton cross section

- ❑ To produce  $10^{12}$  positrons per bunch  $\longleftrightarrow$   $\sim 10$  nc electron bunches
- ❑ Pulse train structure(2820) is set by main linac.
- ❑ Bunch spacing( $\sim 300$  ns) is to be changed in the damping ring(any design)
  - $\sim 3$ ns spacing matches inversion life time of laser ( $3\text{ns} * 2820 = 8.5\text{microsec}$ )
- ❑ Laser Energy limited to  $\sim 1$ J
  - Non linear effects in Compton scattering
- ❑ Laser Focus @ $40\mu\text{m}$ 
  - Practical consideration of e and laser beam focusing
  - 5 ps long laser
- ❑ Reducing charge in bunches(positron stacking) leads to
  - increase in average laser power
- ❑ Gamma beam size is smaller(compared to other designs)
  - compact design of Compton backscattering region
- ❑ Conversion Efficiency (polarized gamma to captured polarized positron)
  - assumed  $\sim 1.5\%$
  - subject to optimization

## Polarized Gamma Beam Generation Summary

| Parameter                    | Symbol               | Single Shot Injection | Stacking mode        | Unit    |
|------------------------------|----------------------|-----------------------|----------------------|---------|
| Rep rate                     | $f_{rep}$            | 5                     | 150                  | Hz      |
| e <sup>-</sup> per bunch     | $n_p$                | $8 \times 10^{10}$    | $8 \times 10^9$      |         |
| Bunches per pulse            | $N_b$                | 2820                  | 2820                 |         |
| Bunch Spacing                | $\tau_b$             | 3                     | 3                    | ns      |
| Beam current (ave./pulse)    | $I_{beam}$           | 0.2 / 4               | 0.6 / 0.4            | mA / A  |
| Average beam power           | $P_{beam}$           | 1                     | 3                    | MW      |
| Number of lasers             | $N_{laser}$          | 15                    | 5                    |         |
| Laser pulse length           | $\tau_{laser}$       | 5                     | 5                    | ps      |
| Intra cavity energy          | $E_{laser}$          | $8 \times 0.8$        | $8 \times 0.8$       | J       |
| Size at focus                | $\sigma_{laser}$     | 40                    | 40                   | $\mu m$ |
| Efficiency per laser IP      | $N_\gamma / N_{e^-}$ | 1                     | 1                    |         |
| Number of $\gamma$ per bunch | $N_\gamma$           | $1.5 \times 10^{12}$  | $1.5 \times 10^{12}$ |         |

# Ring Or Linac?

## □ 6 GeV Compton Ring

- rms energy spread ~ 2%
  - CO<sub>2</sub> laser interaction with 4MW synchrotron radiation.
- Difcult ring design
- Very difficult laser design
  - high repition rate
  - high average power
  - cavity stacking

## □ Aperture Requirements of Ring Design

- small angle Compton back scattering
  - less efficient

## □ Linac Design

- Head On Compton back scattering

# Stacking or No Stacking?

## No Stacking

- High current in macro-pulse (~ 4 A)
  - short accelerator sections,
  - more klystrons
  - longer linac

## Stacking

- High repetition
  - average beam power inc
  - **3MW** for 150Hz.
- Linac
  - SuperConducting
  - NormalConducting

*•Simpler damping ring and laser system at 5Hz for the scheme without accumulation may offset linac complexity.*

# Laser System

1. CO<sub>2</sub> oscillator pulse ~100ns  
Sliced with a Yag pulse train
2. CO<sub>2</sub> laser train  
seeded inside regenerative amplifier cavity  
round trip 24ns(3\*8)
3. Amplified pulses are dumped from cavity (pockels cell)
4. Split into 10 beams
5. After Amplification (~1J)  
each 8 pulse train → ring cavity

# Status Of Laser System For Polarized Positron Source

- ✓ Optical slicing and amplification
  - demonstrated at ATF
  - routine for user experiments\*
- ✓ CO<sub>2</sub> oscillator and amplifier
  - commercially available from SDI
  - rep rate up to 500Hz
- ❖ Final Intra-cavity amplifiers
  - average power 10-20 Kw(150Hz)
  - Needs R&D
- ❖ Optical elements
  - need to withstand high intra-cavity power
  - to be addressed by industry

# Laser From SDI

<http://www.lightmachinery.com/SDI-CO2-lasers.html>

WH10

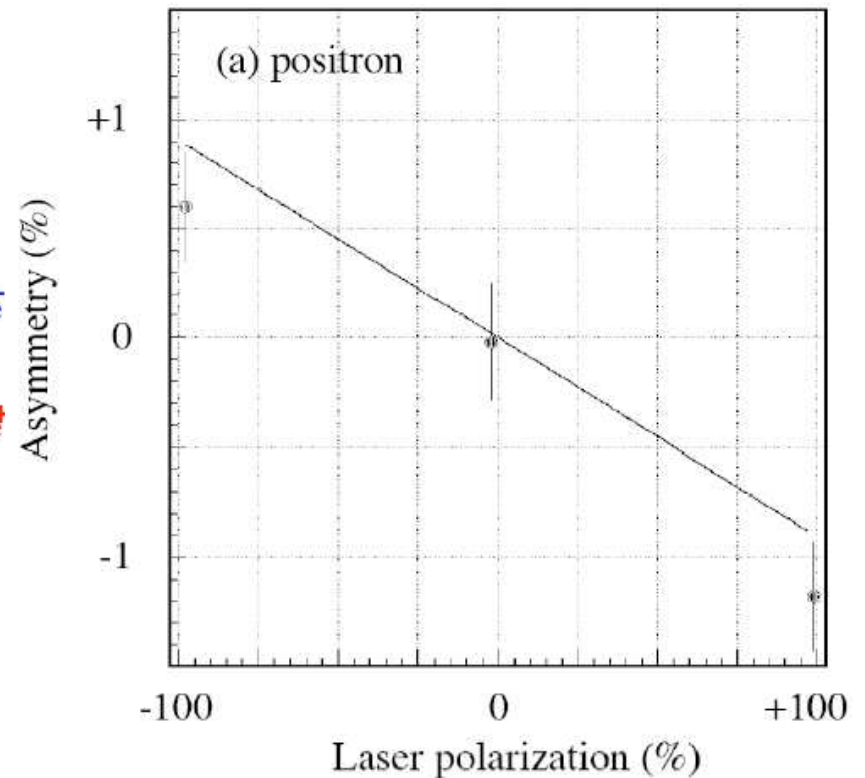

# Compton Experiment at ATF, Brookhaven (record number of X-rays with 10 $\mu\text{m}$ laser)

- X rays generated  $> \sim 10^8$  [PR ST 2000](#)
- $N_x/N_e \sim 0.1$
- Interaction point with high power laser focus of  $\sim 30\mu\text{m}$  was tested.
- Nonlinear limit (more than one laser photon scattered from electron) was verified. [PRL 2005](#).

# Compton Experiment at KEK ATF (polarized positrons with 532 nm laser)

- Demonstrated beam of  $10^6$  polarized  $\gamma$ -rays (PRL 91/16, 2003)
- Demonstrated  $10^4$  positron beam with 79% polarization level (KEK Preprint 2005-56, PRL 2005)

# Conclusion

- ❑ We propose a Polarized Positron Source.
  - based on Compton back scattering inside optical cavity of CO<sub>2</sub> laser beam and 6 GeV e-beam produced by linac.
- ❑ The proposal utilizes commercially available units for laser and accelerator systems.
- ❑ The proposal requires high power picosecond CO<sub>2</sub> laser mode of operation developed at ATF
- ❑ 3 year laser R&D is needed to verify laser operation in the non standard regime.
