

Signals of Universal Extra Dimensions at the ILC

Friday, 10 March 2006 09:25 (25 minutes)

The Universal Extra Dimension models are supposed to mimic SUSY at colliders. They are also of interest as a source of cold dark matter. I discuss how ILC can discriminate between UED and SUSY from lepton pair production. I will also discuss how, in UED, single production of $n=2$ electroweak gauge bosons as s-channel resonances (much in the same vein as LEP) may lead to a precision study of these models.
