

Search for low mass BSM particles using $h(125)$

Chayanit Asawatangtrakuldee — DESY

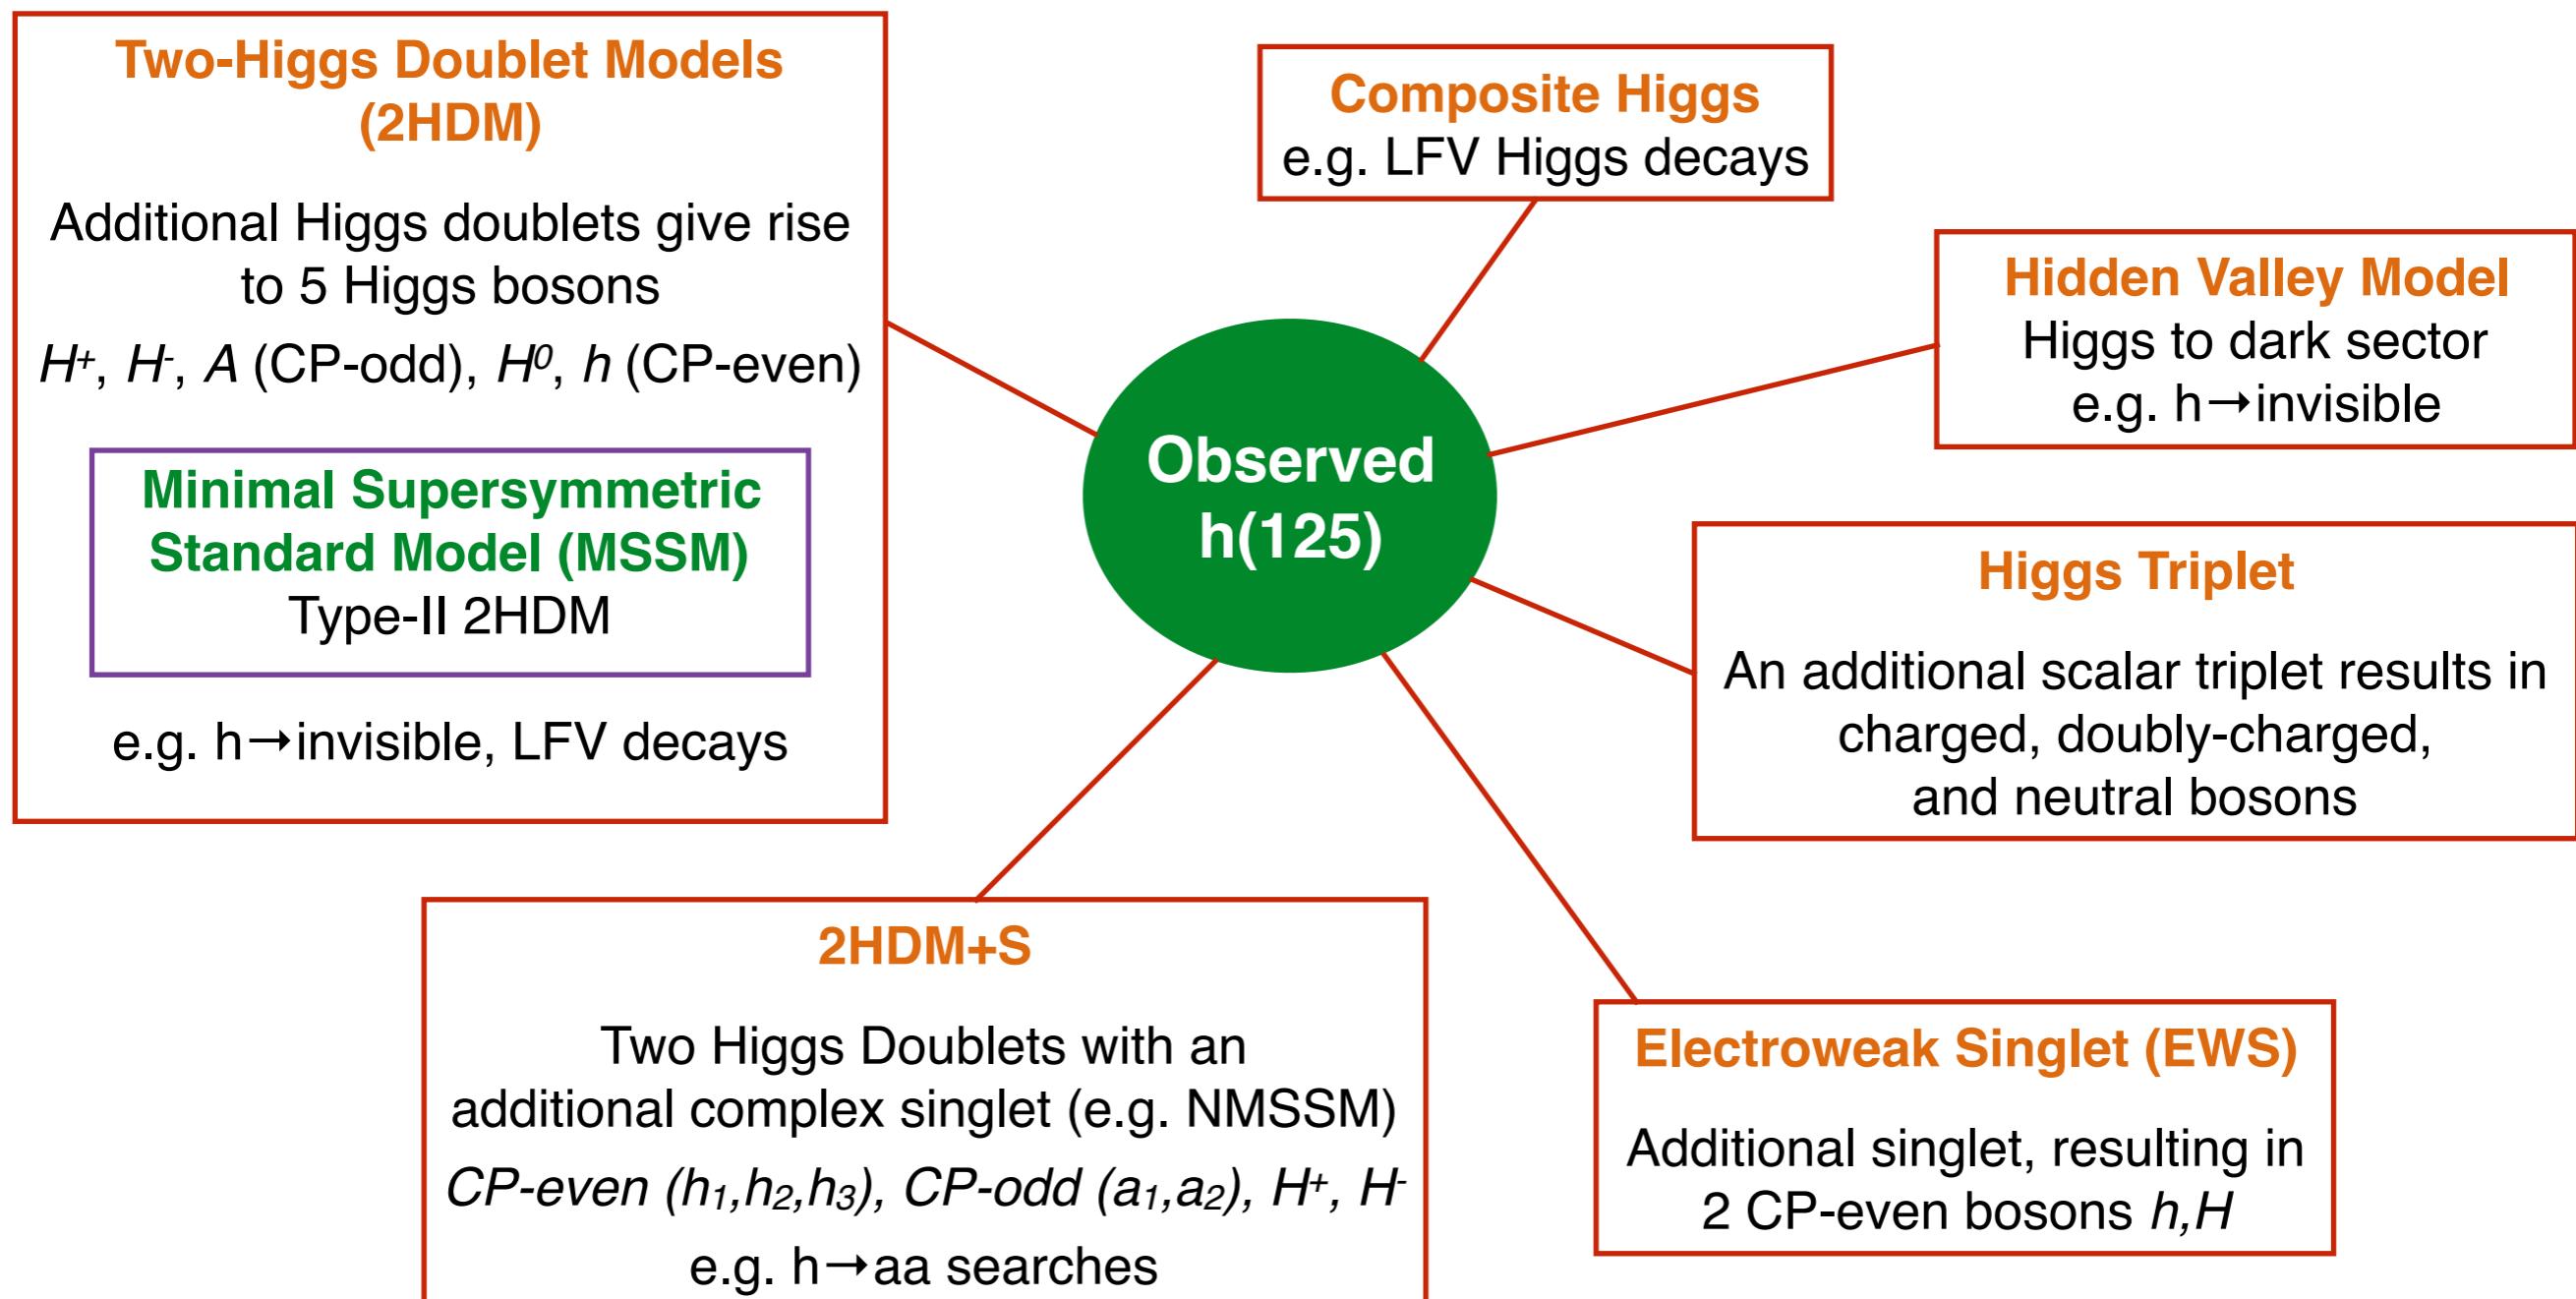

on behalf of the CMS Collaboration

DIS2017

University of Birmingham, UK (3-7 April 2017)

Introduction

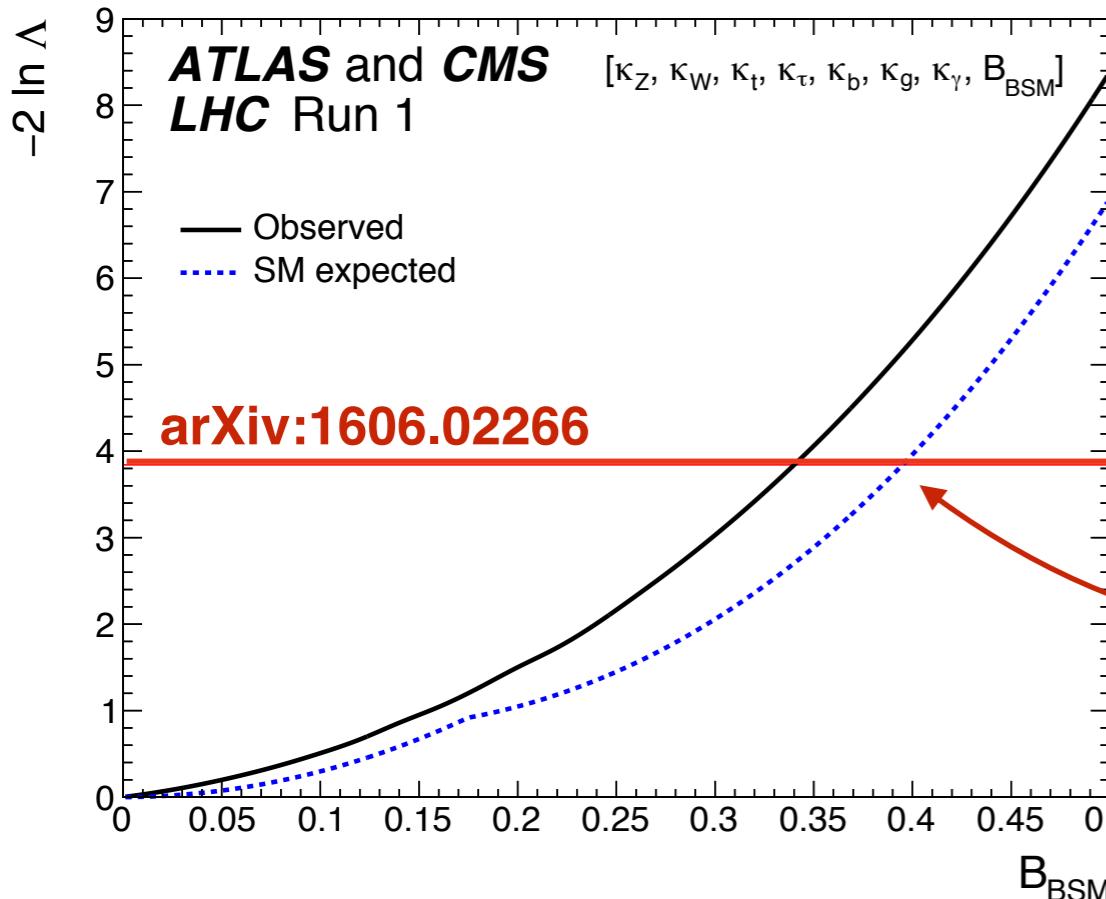

- ◆ The discovered Higgs boson at 125 GeV play a central role in probing physics beyond the Standard Model (BSM)
- ◆ Many BSM theories predicted several BSM decay modes of $h(125)$

h(125) → invisible

$h(125) \rightarrow \text{invisible}$

- ◆ Indirect constraints from LHC couplings
 - ▶ no invisible channels included
 - ▶ assuming $|\kappa_V| \leq 1, B_{\text{BSM}} \geq 0$

$\text{Br}(h \rightarrow \text{BSM})$

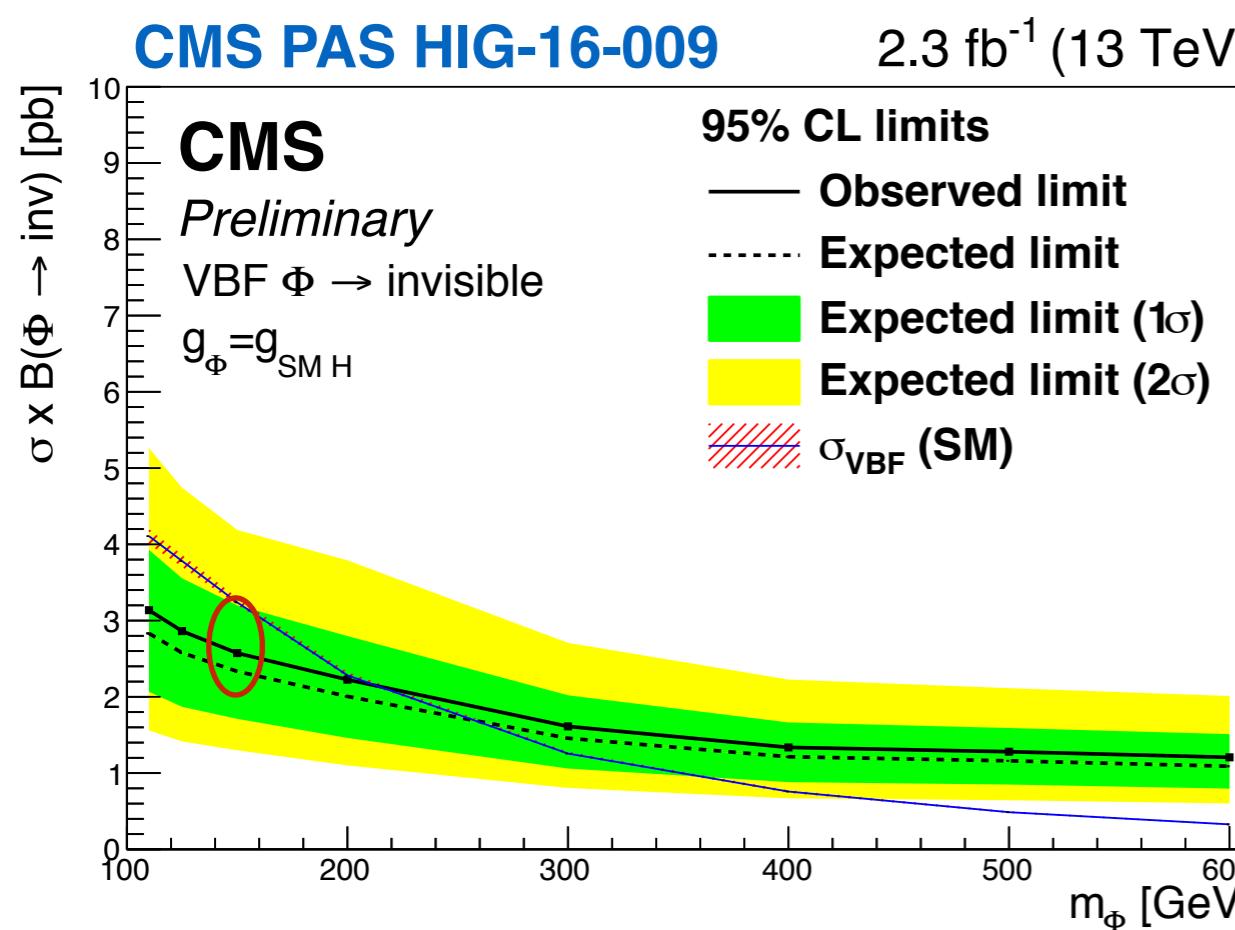

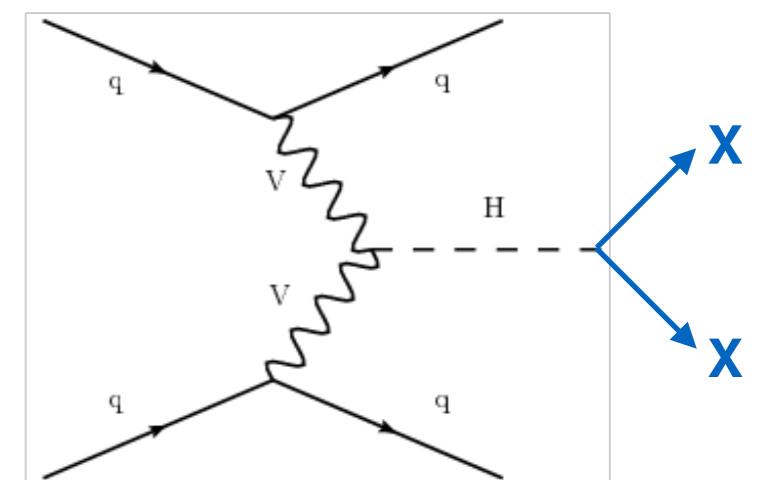

< **0.34 (0.39)** obs (exp)

- ◆ $\text{Br}(h \rightarrow \text{invisible})$ in the SM, Higgs can only decay via $H \rightarrow ZZ^* \rightarrow 4\nu$ ($\sim 0.1\%$)
 - ▶ a hint of new physics e.g. dark matter

- ◆ **Direct searches** must be performed in channels where the Higgs recoils against a visible system
 - ▶ vector boson fusion (VBF)
 - ▶ associated with vector bosons (VH)
 - ▶ gluon fusion (ggH)

VBF $h \rightarrow \text{invisible}$

- ◆ Signal characteristics : **2 jets large $\Delta\eta_{jj}$, M_{jj} + large missing E_T**
- ◆ Dominant backgrounds from **SM $Z(\nu\nu)/W(l\nu)+\text{jets}$**
 - ▶ lepton control regions in data to normalize MC
- ◆ Signal extraction based on counting experiment
 - ▶ simultaneous fit in 5 control + signal regions

- ◆ Systematic uncertainties driven by **JES/JER**
- ◆ Limit on **$\sigma \times \text{Br}$** as a function of mass
 - ▶ assuming SM Higgs cross-section

@125 GeV, $\text{Br}(h \rightarrow \text{invisible})$
 $< \mathbf{0.69 \ (0.62)}$ obs (exp)*

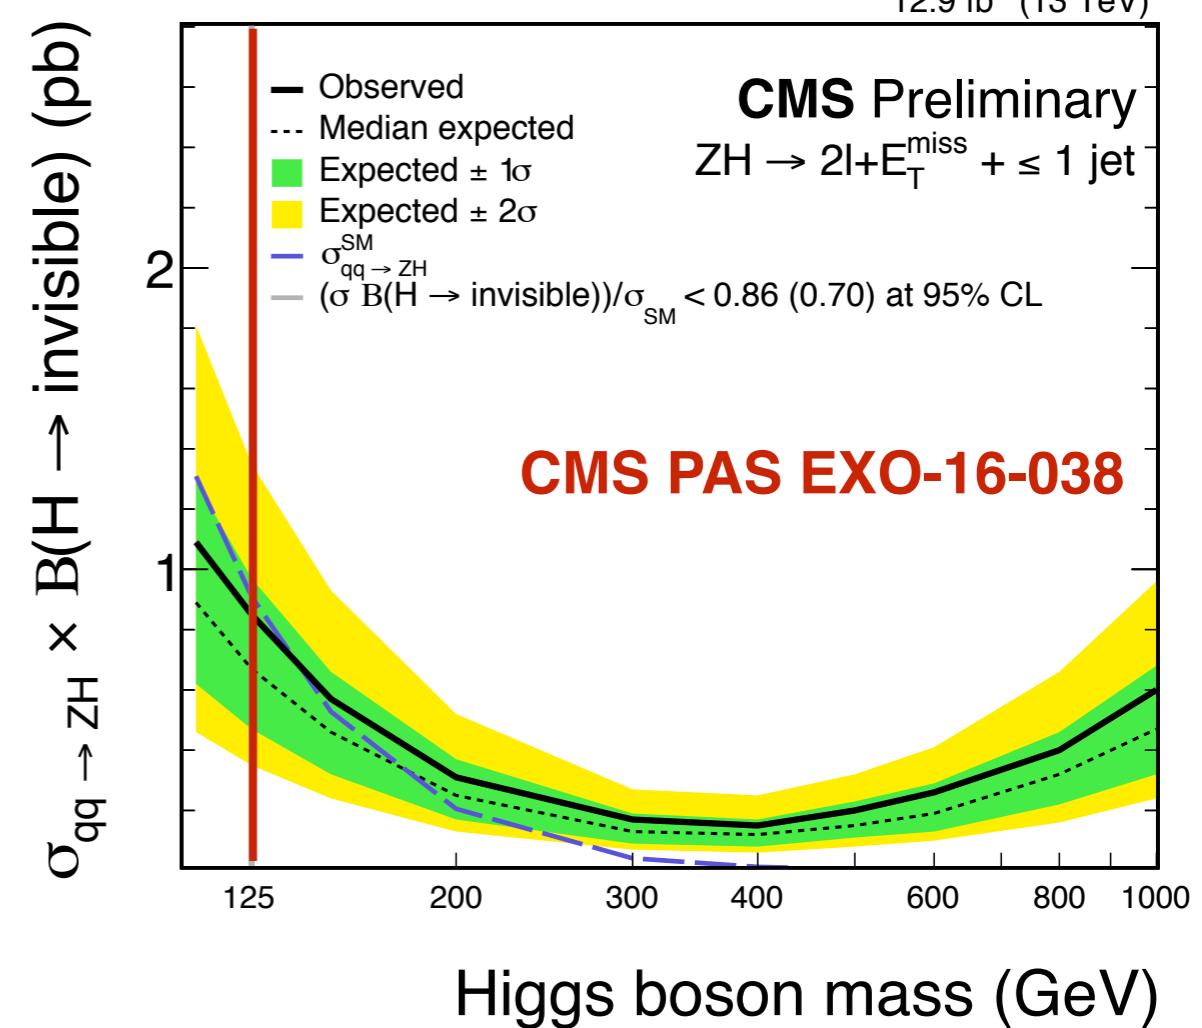

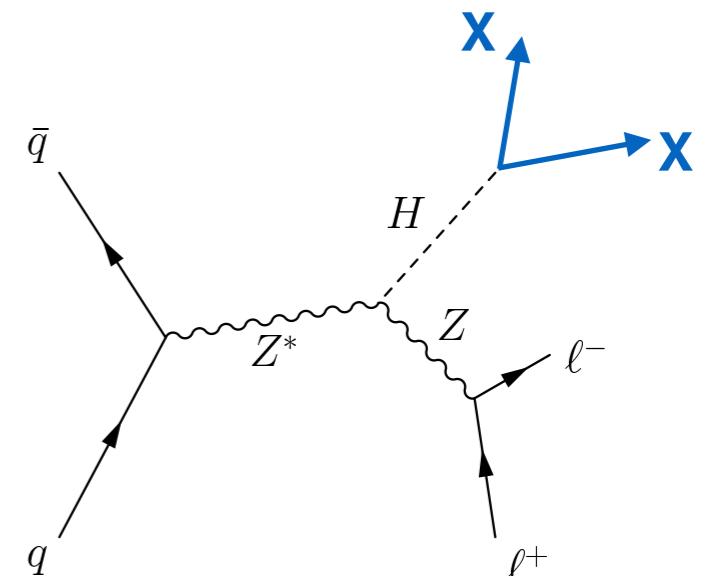

* $\text{Br}(h \rightarrow \text{invisible}) < 0.65 \ (0.49)$ obs (exp) at 8 TeV

Z(ll)h \rightarrow invisible

- ◆ Clean final state from leptonic Z decay
 - ▶ events with **missing $E_T + 2$ leptons ($e^+e^-/\mu^+\mu^-$)**
- ◆ Backgrounds dominated by **diboson processes**
 - ▶ ZZ($2l2\nu$) (70%), WZ($l\nu ll$) (25%) from MC
- ◆ Signal extraction by fitting **m_T distribution** in 0-, 1-jet categories

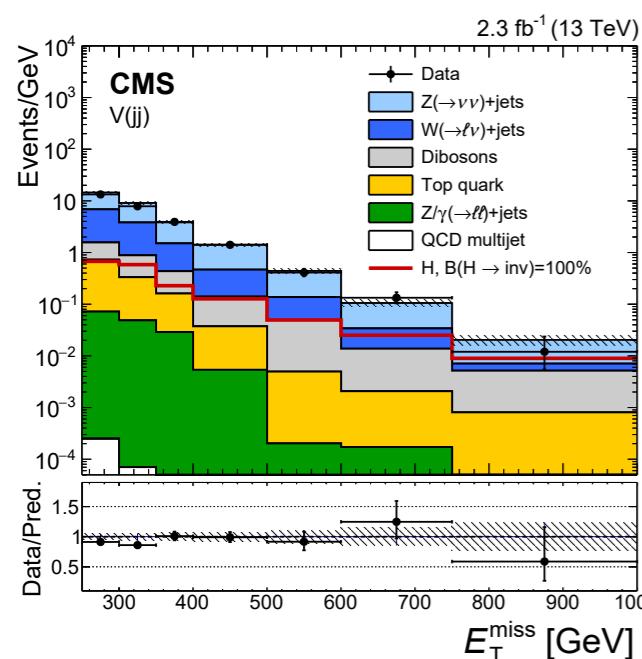

$$m_T = \sqrt{2p_T^{\ell\ell}E_T^{\text{miss}} [1 - \cos \Delta\phi(\ell\ell, \vec{p}_T^{\text{miss}})]}$$

Assuming SM Higgs cross-section
 @125 GeV, Br(h \rightarrow invisible)
 < **0.86 (0.70)** obs (exp)

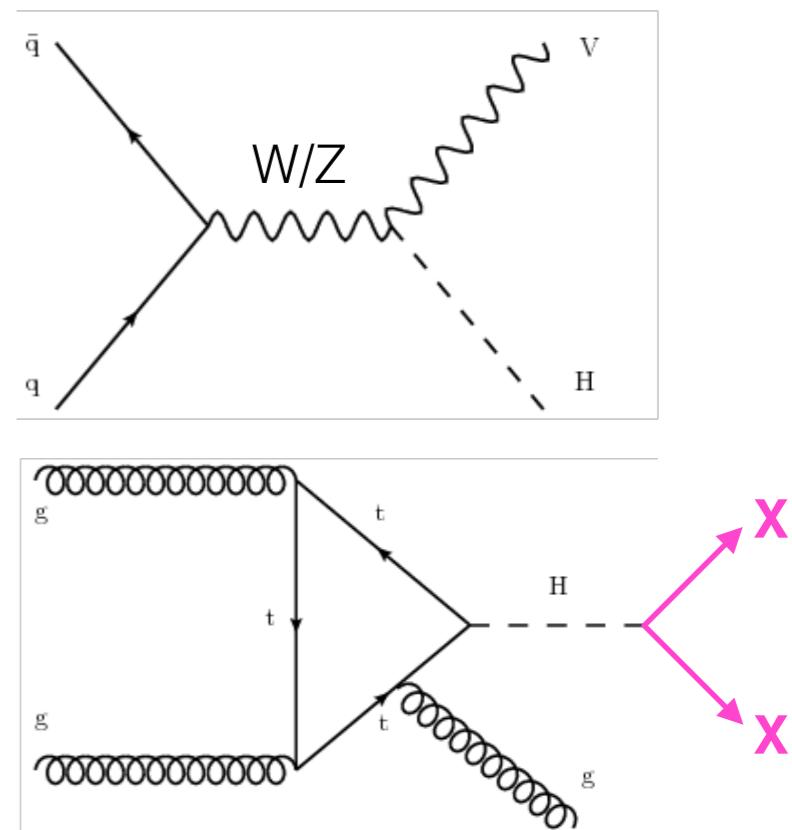

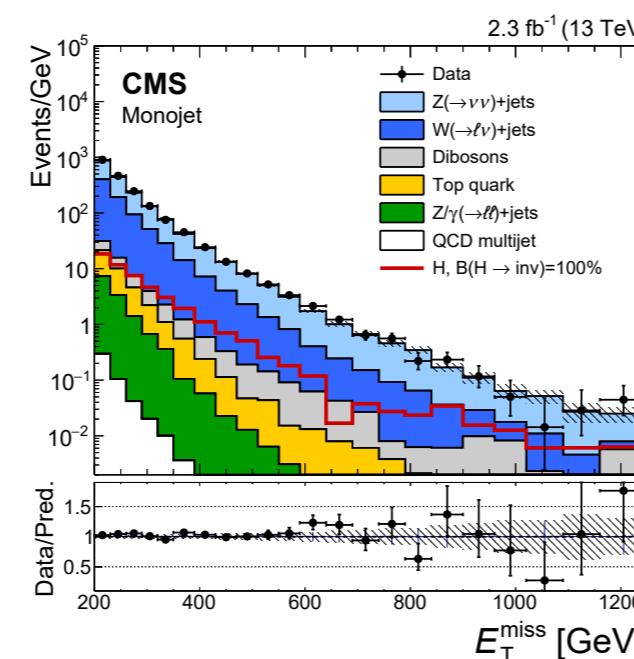

V(jj)h & ggh \rightarrow invisible

- ◆ Both look for events with **Jet+missing E_T** (VBF veto)
 - ▶ “fat” jet from W/Z decays hadronically
 - ▶ “central” jet from a gluon/quark ISR
- ◆ Dominant backgrounds arise from **W/Z($\nu\nu$)+jets**

CMS PAS EXO-16-037

CMS PAS HIG-16-016

- ◆ Signal extracted from fit to Missing E_T spectrum

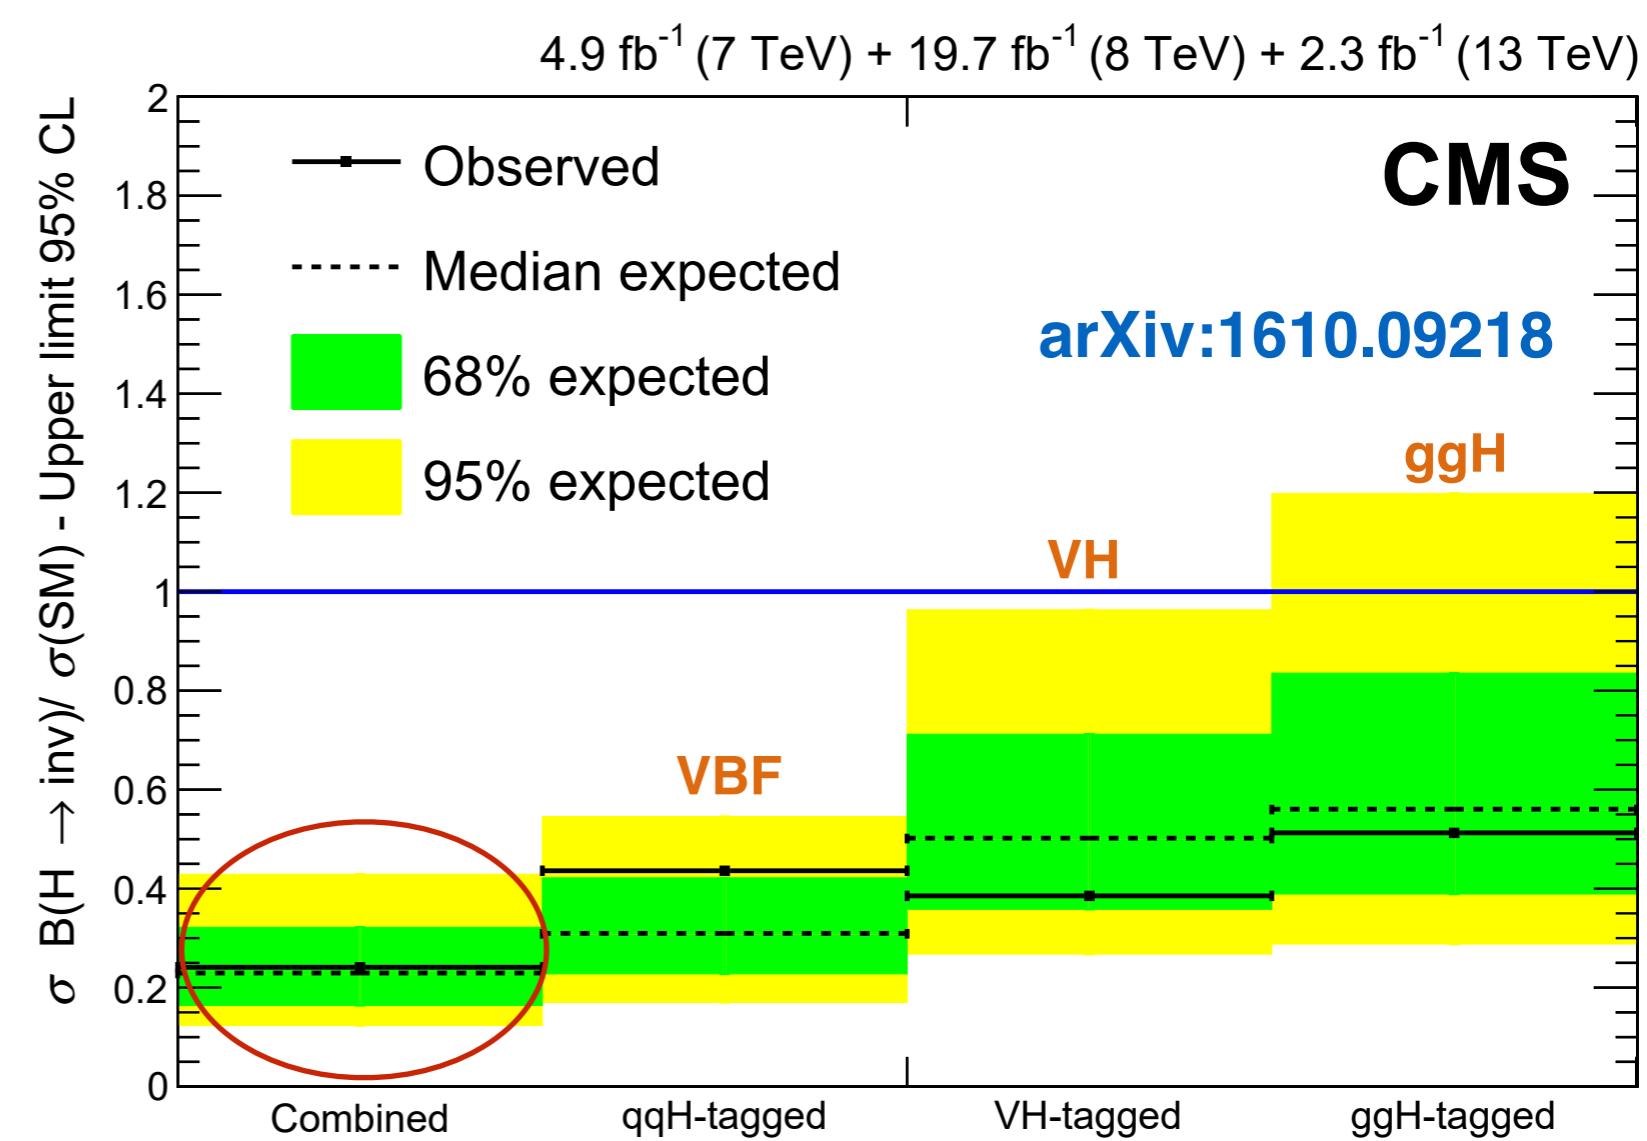

Limits with 12.9	Expect	Observed
V(jj)h \rightarrow invisible	0.72	1.17
ggh \rightarrow invisible	0.85	0.48
combined	0.56	0.44

Upper limits on **$\sigma_X Br / \sigma_{SM}$**
 for Higgs decaying invisibly
 @125 GeV

Combination $h \rightarrow \text{invisible}$

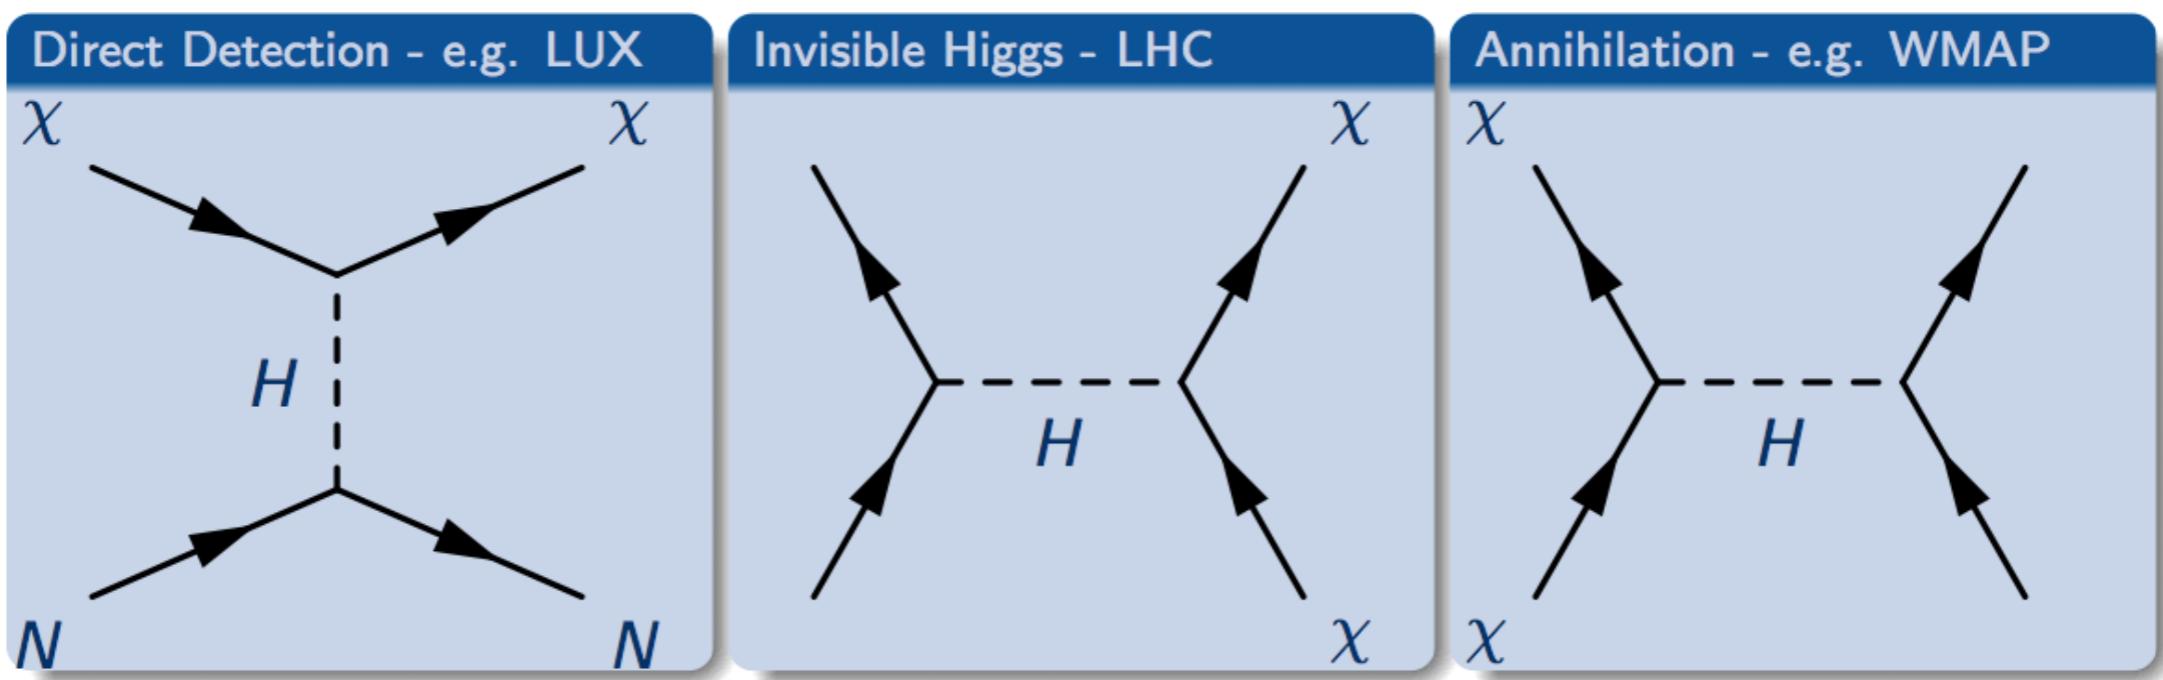

- ♦ No significant deviations from the SM expectations are observed
- ♦ Combination of $h \rightarrow \text{invisible}$ searches performed using **Run-1 dataset** and **2.3 fb^{-1} of 13 TeV (2015) data**
 - 95% CL upper limits on **$\sigma \times \text{Br}$** relative to SM production is estimated
- ♦ VH includes $Z(l\bar{l})$, $Z(bb)$ and $V(jj)H$ channels

**Br($h \rightarrow \text{invisible}$)
< 0.24 (0.23) obs (exp)
@ 125 GeV 95% CL**

Higgs-Portal Model

- ♦ If dark matter (DM) couples to the Higgs, the following diagrams are possible

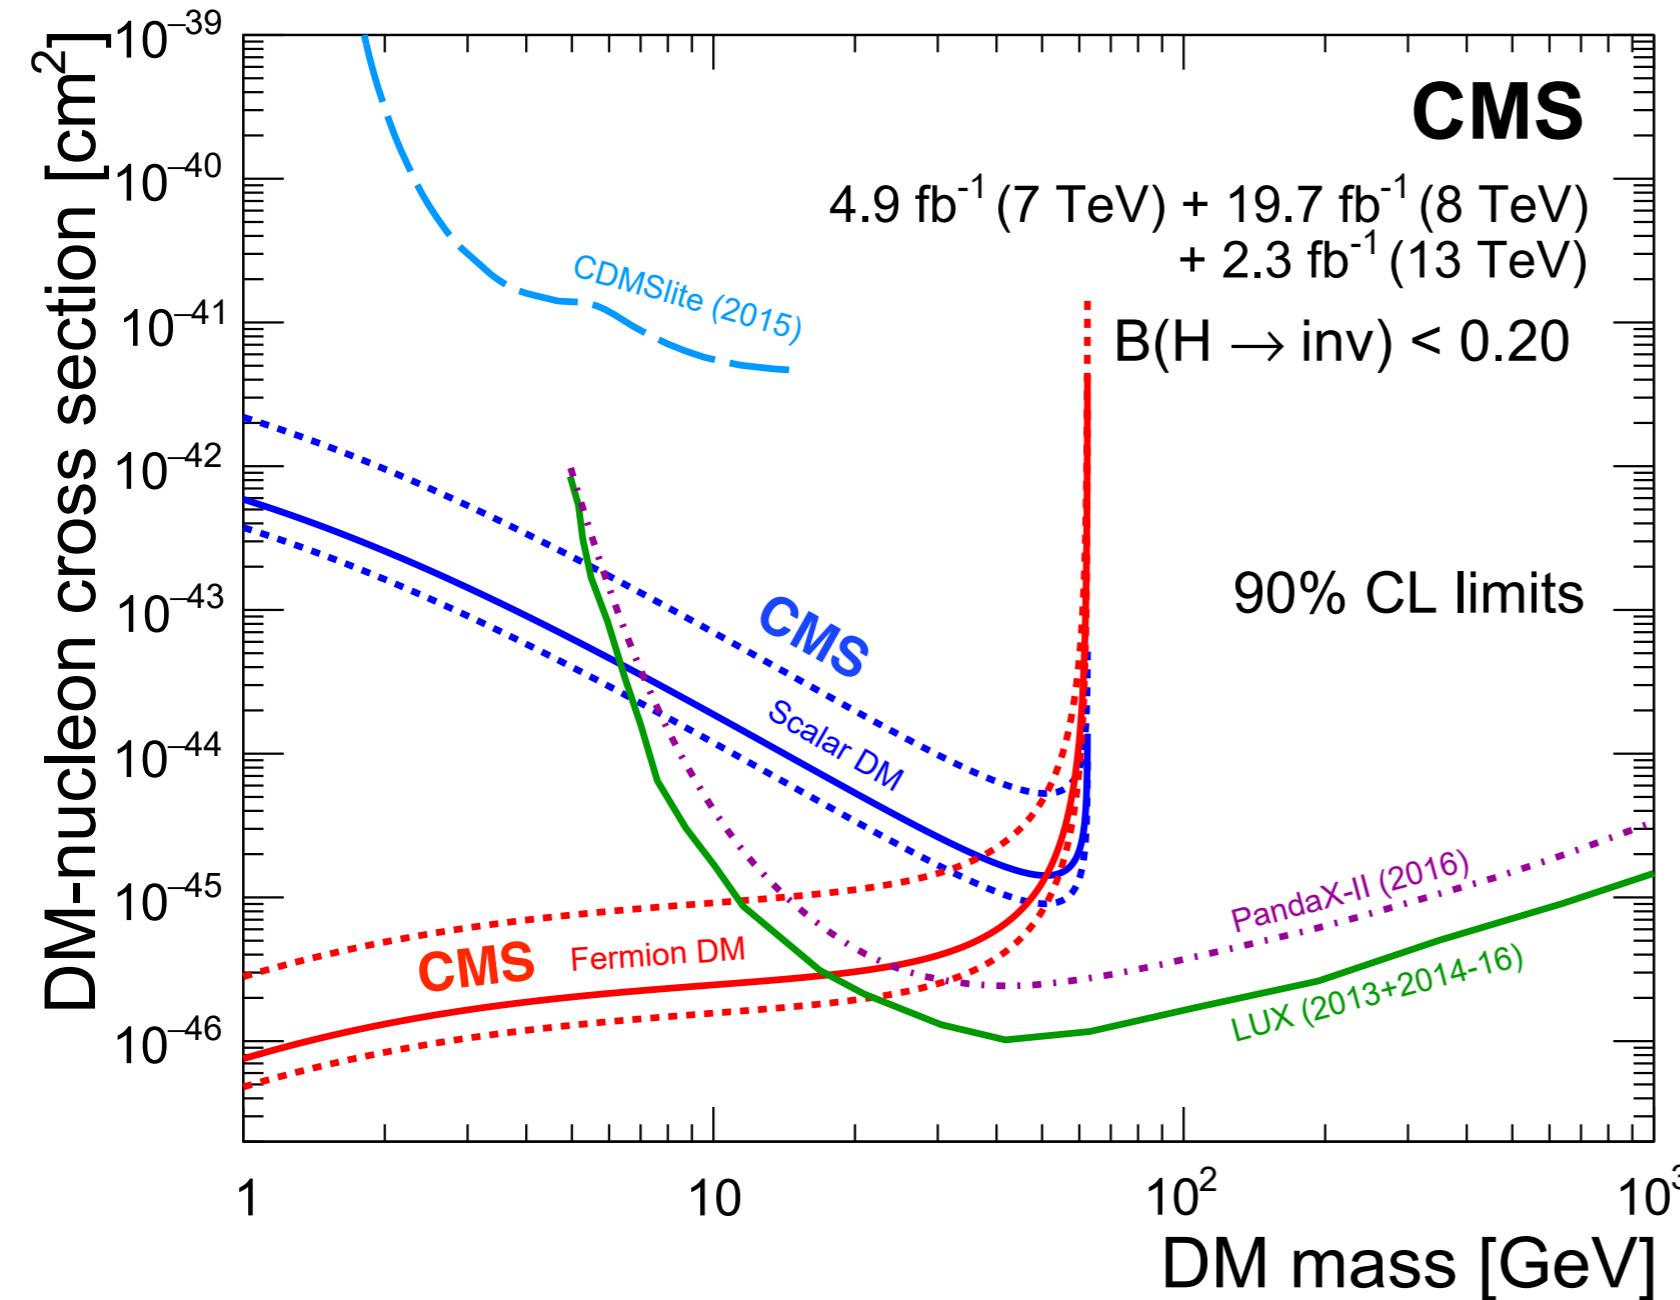

- ♦ **Br($h \rightarrow \text{invisible}$)** translated into **DM-nucleon spin-independent cross section** limits as a function of DM mass (if DM mass $< m_h/2$)*

*A. Djouadi et al, Phys. Lett. B 709 (2012)

Dark Matter Interpretation

CMS PAS HIG-16-016

arXiv:1610.09218

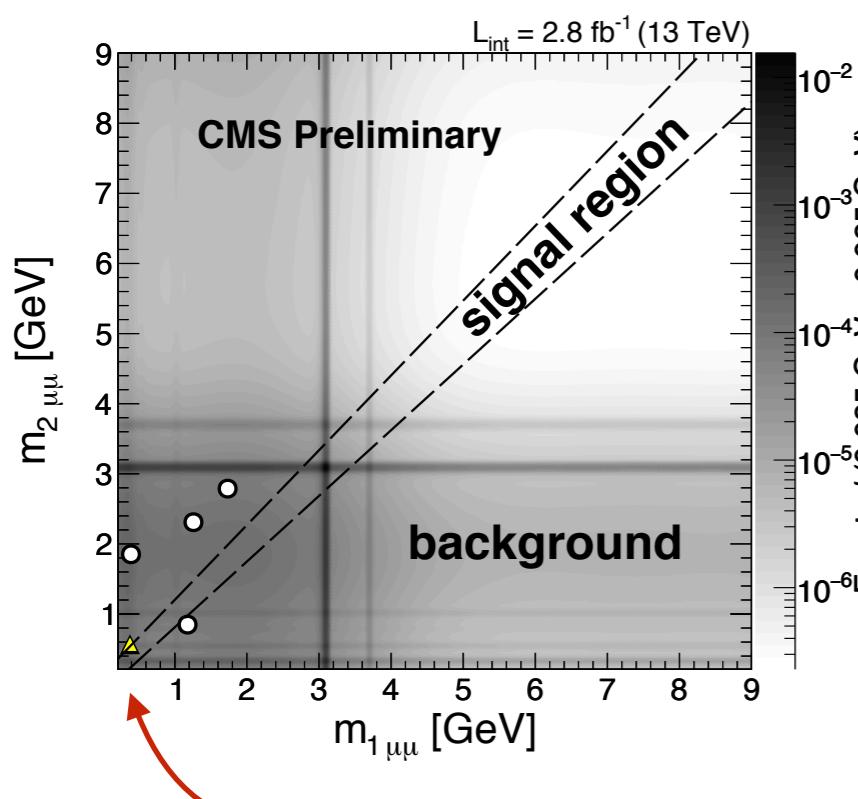

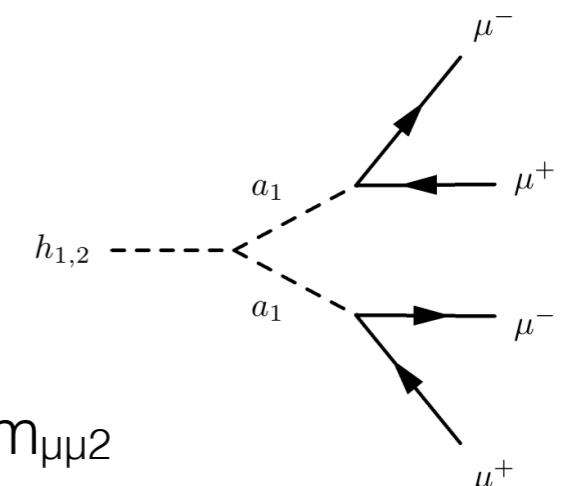

- ◆ Assuming **scalar, fermion** dark matters
- ◆ 90% CL to compare with direct detection experiments
 - ▶ **LUX, PandaX-II, CDMSlite**
- ◆ CMS limits more stringent for small DM masses

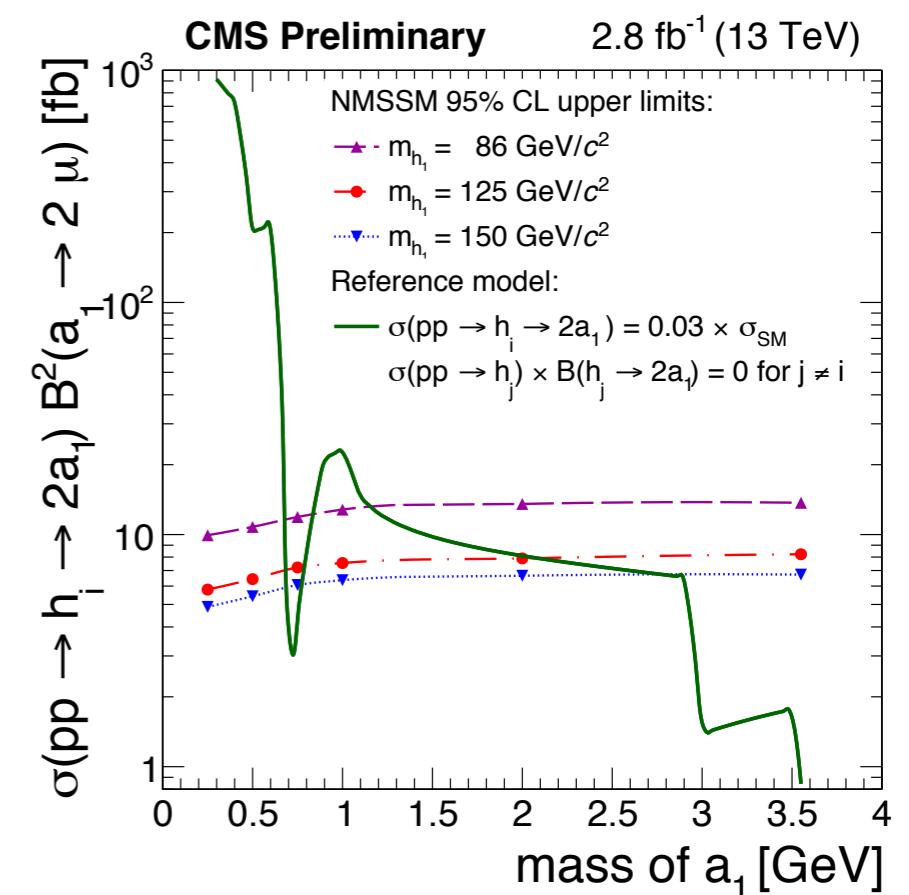

$h(125) \rightarrow aa$

- ◆ Two models interpretation
 - ▶ **NMSSM** : $h \rightarrow aa \rightarrow 4\mu$ ($2m_\mu \leq m_a \leq 2m_\tau$)
 - ▶ **Dark SUSY** : $h \rightarrow 2n_1 \rightarrow 2n_D + 2\gamma_D \rightarrow 4\mu$ ($m_h > m_{n_1}$)
- ◆ Mass range of $m_a \in 0.25$ to 3.55 (8.5) GeV
- ◆ Main backgrounds from bb , J/Ψ and EWK $pp \rightarrow 4\mu$
- ◆ **No excess data is observed** : diagonal signal region : $m_{\mu\mu 1} \approx m_{\mu\mu 2}$

CMS PAS HIG-16-035

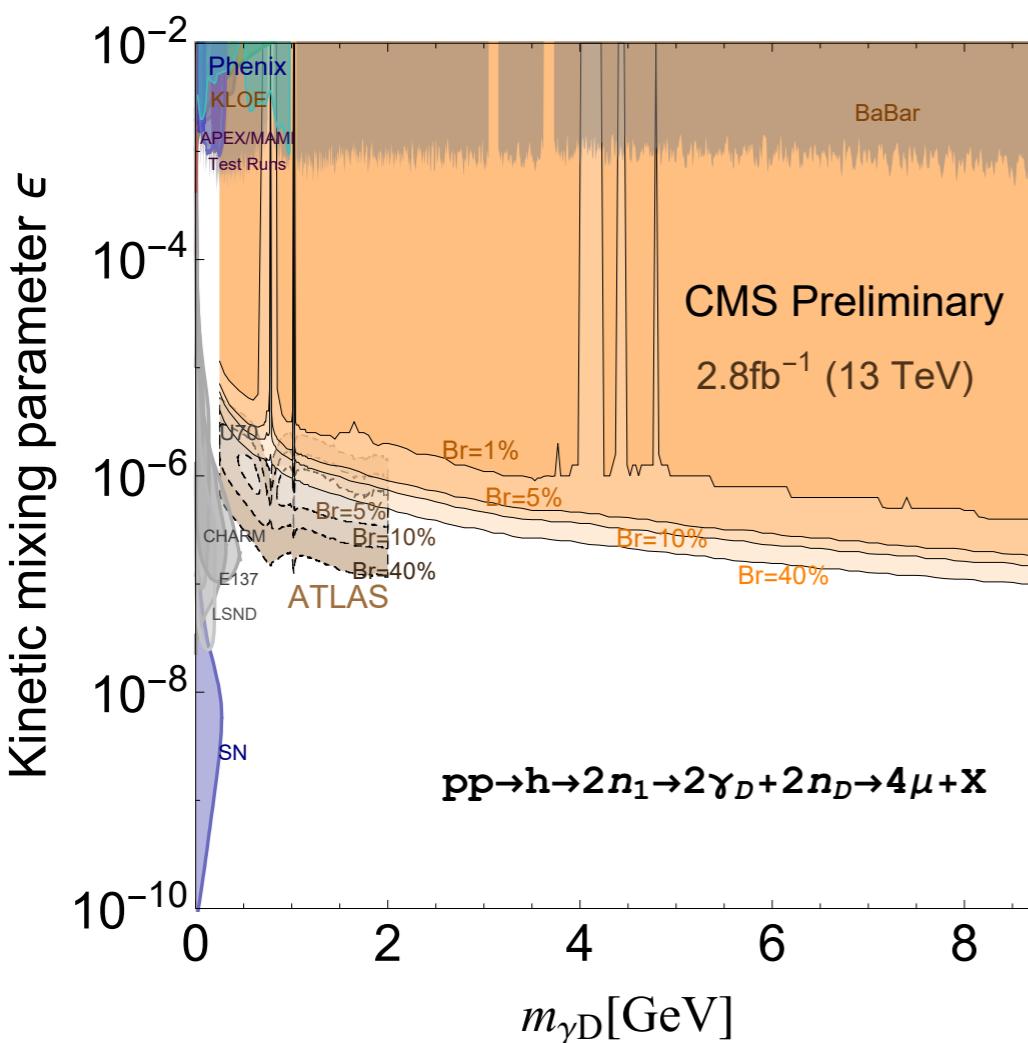

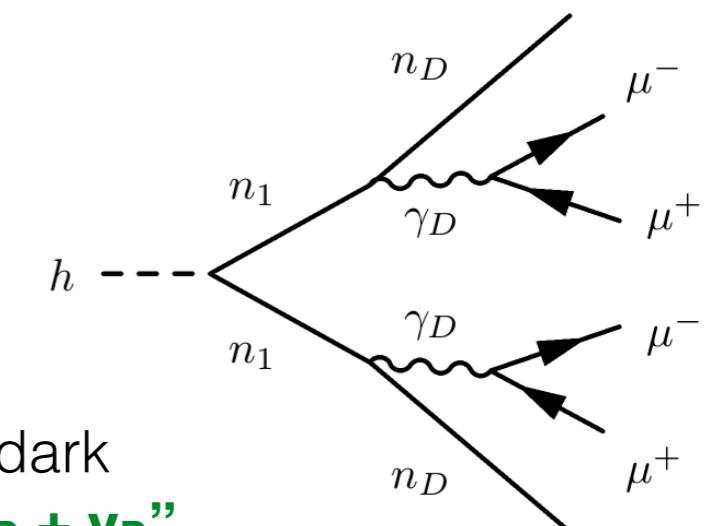

- NMSSM limits**
- ◆ 95% CL upper limits as functions of m_{a_1} for $m_{h_1} = 86, 125, 150$ GeV

♦ **Dark SUSY Interpretation :**

- predict cold dark matter at $\sim 1\text{TeV}$ scale
- $U(1)_D$ is broken, giving rise to light dark photons (γ_D)
- γ_D weakly couples to SM particles via small kinetic mixing (ε)
- Lightest neutralino (n_1) is no longer stable and can decay to a dark neutralino (escape from detection) and a dark photon “ $n_1 \rightarrow n_D + \gamma_D$ ”

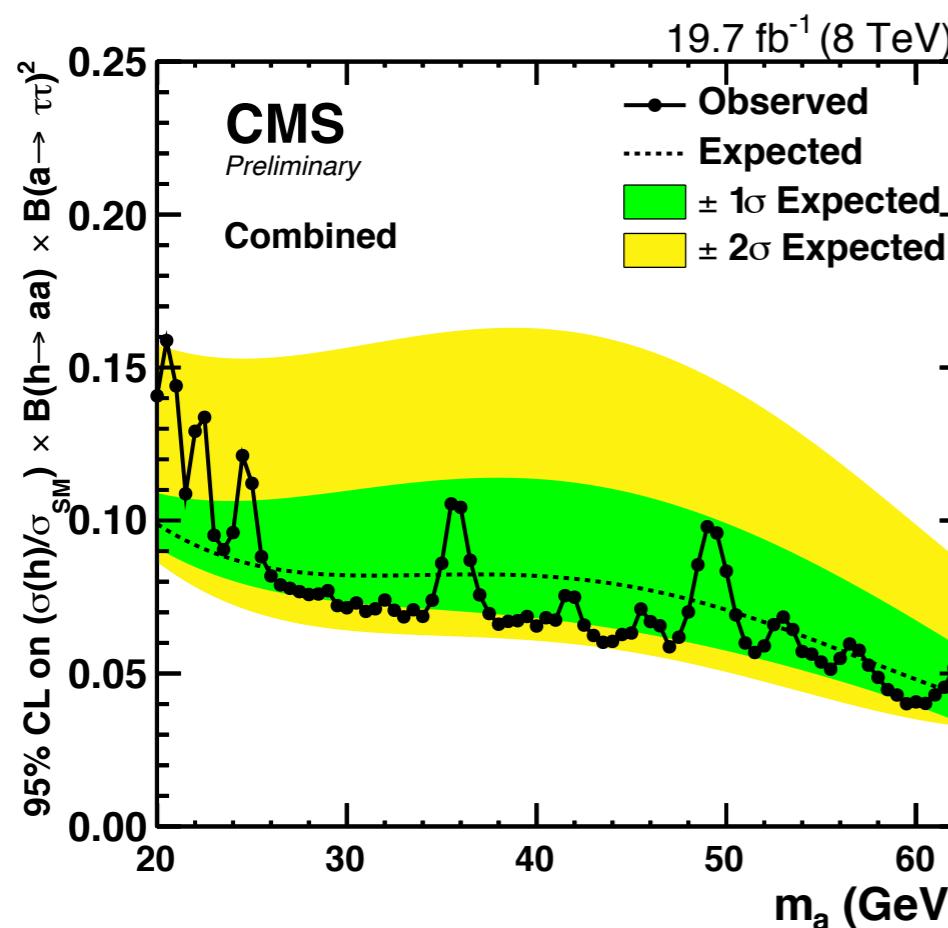

CMS PAS HIG-16-035

- ♦ 95% CL upper limits on
- $\sigma(pp \rightarrow h \rightarrow 2\gamma_D + X)\text{Br}(h \rightarrow 2\gamma_D + X)$
- colored contours represent different values of $\text{Br}(h \rightarrow 2\gamma_D + X)$ in the range 1-40%
 - assumed $m_{n1} = 10\text{ GeV}$, $m_{nD} = 1\text{GeV}$

$h \rightarrow aa \rightarrow 2\mu 2\tau$

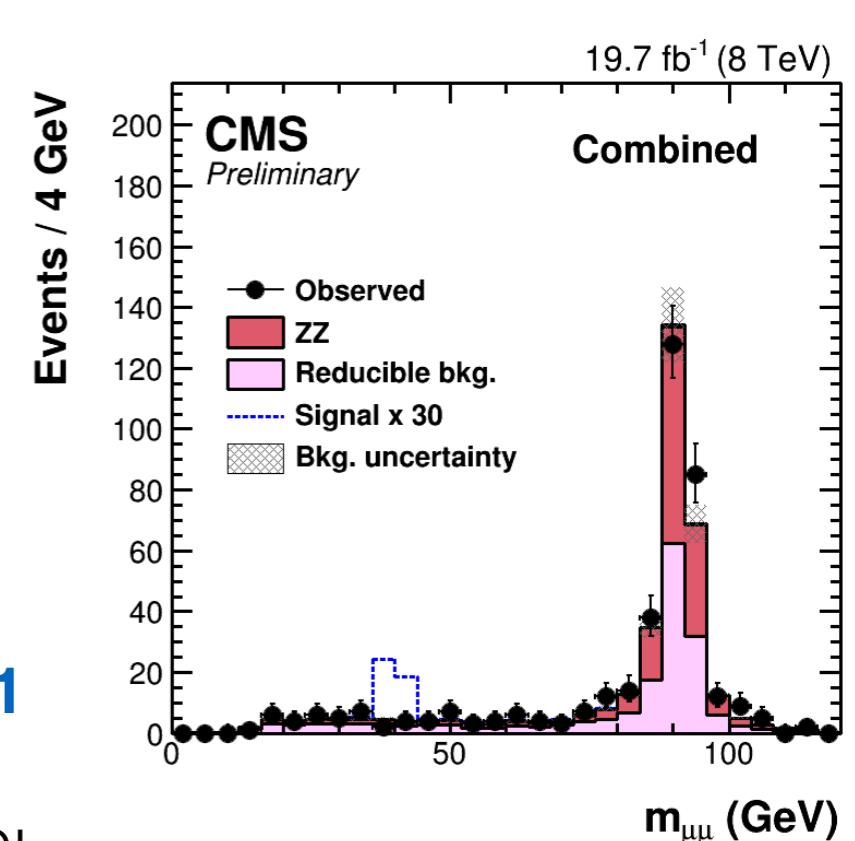

- Reconstructed events with 2μ (good resolution) plus 2τ
 - combined 5 final states $\rightarrow \mu\mu\tau_e\tau_e, \mu\mu\tau_e\tau_\mu, \mu\mu\tau_e\tau_h, \mu\mu\tau_\mu\tau_h$ and $\mu\mu\tau_h\tau_h$
- Limits set on $\text{Br}(h \rightarrow aa) \times \text{Br}(a \rightarrow \tau\tau)^2$ from an unbinned fit of $m_{\mu\mu}$ distributions with the following relation

$$\frac{\Gamma(a \rightarrow \mu\mu)}{\Gamma(a \rightarrow \tau\tau)} = \frac{m_\mu^2 \sqrt{1 - (2m_\mu/m_a)^2}}{m_\tau^2 \sqrt{1 - (2m_\tau/m_a)^2}}.$$

CMS PAS HIG-15-011

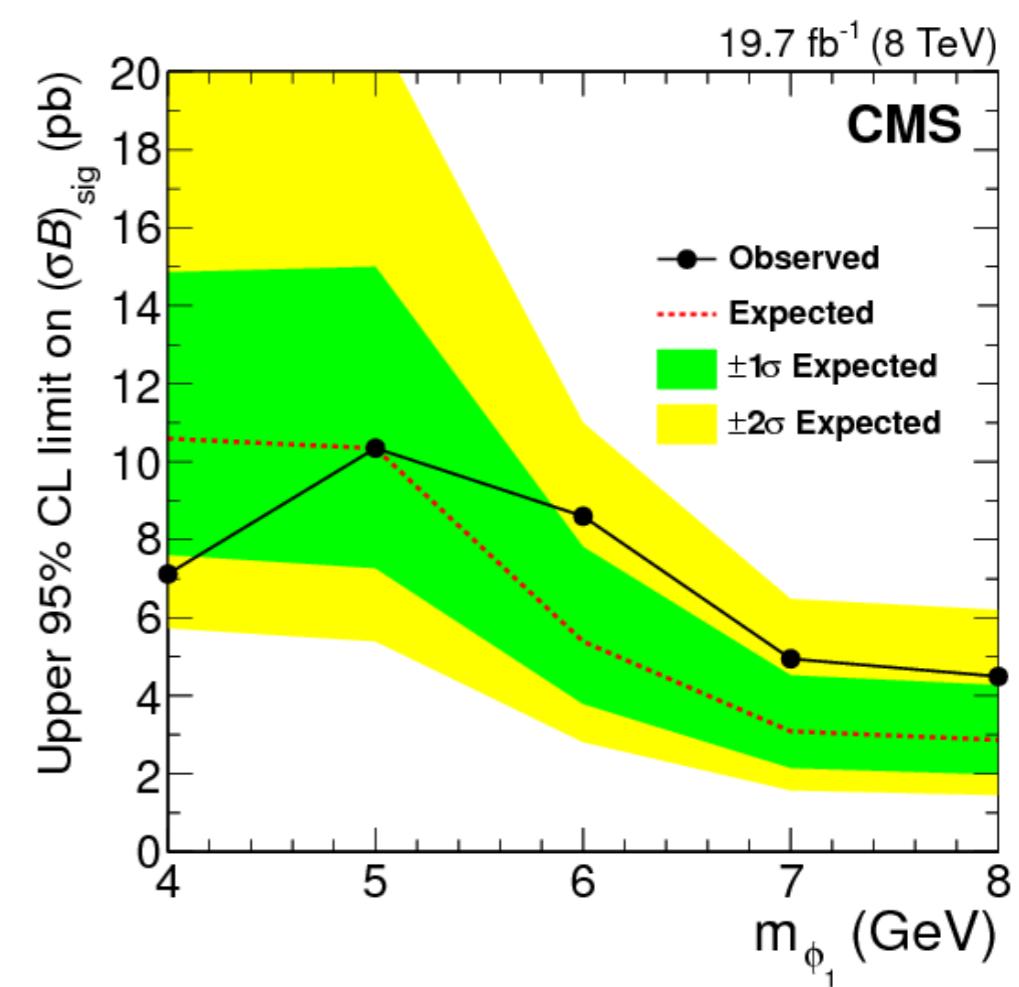

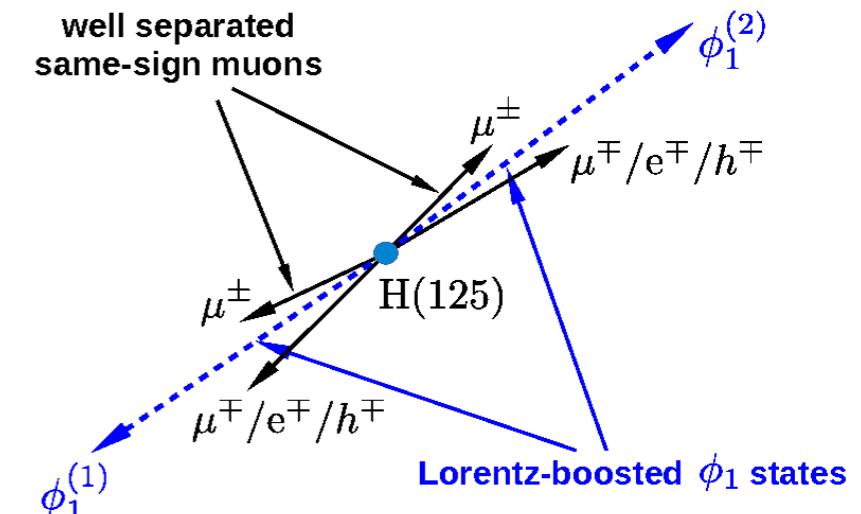

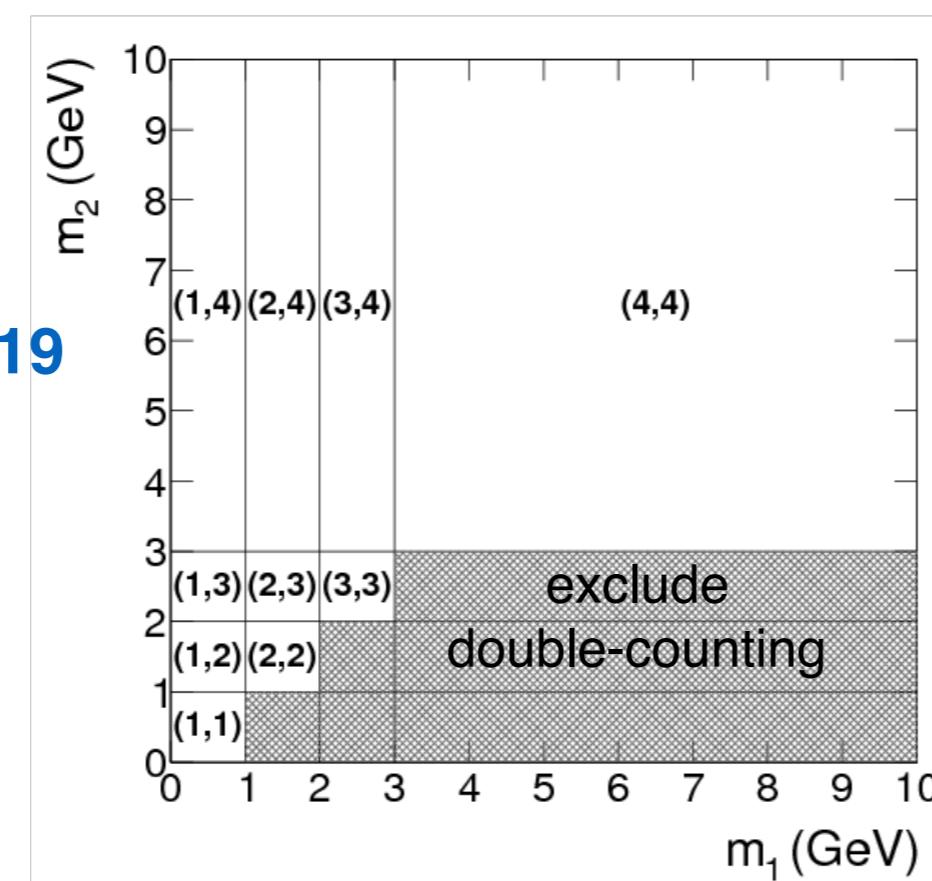

Upper limits at 95% CL
on $h \rightarrow aa$ relative to the SM Higgs
production, scaled by $\text{Br}(a \rightarrow \tau\tau)^2$ placed
between **4-15% for $m_{\mu\mu} \in 20$ to 62.5 GeV**

$h \rightarrow aa \rightarrow 4\tau$ (1)

- ◆ Focus $ggh \rightarrow aa \rightarrow 4\tau$
 - ▶ same-sign di-muon events with large angular separation plus one nearby opposite-sign track ($\mu + \text{track}$)
- ◆ Signal extracted with binned maximum likelihood fit to the 2D distribution of $(m_{\mu\text{track}1}, m_{\mu\text{track}2})$
- ◆ **No excess is observed**
 - ▶ upper limits range from 4.5 pb at $m_{\phi_1}(m_h) = 8$ GeV to 10.3 pb at $m_{\phi_1}(m_h) = 5$ GeV

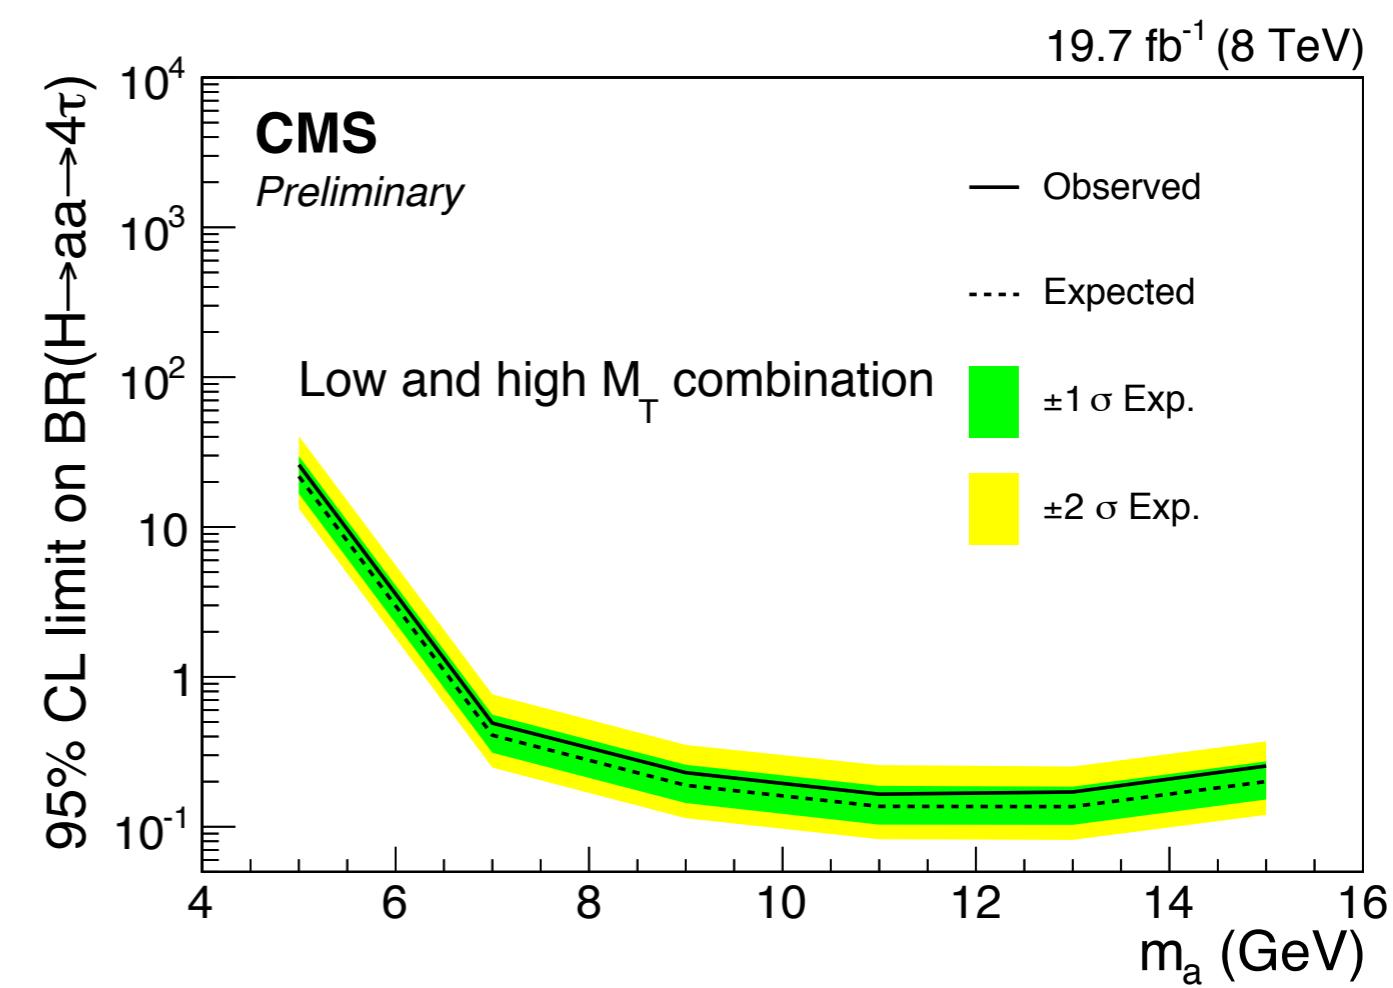

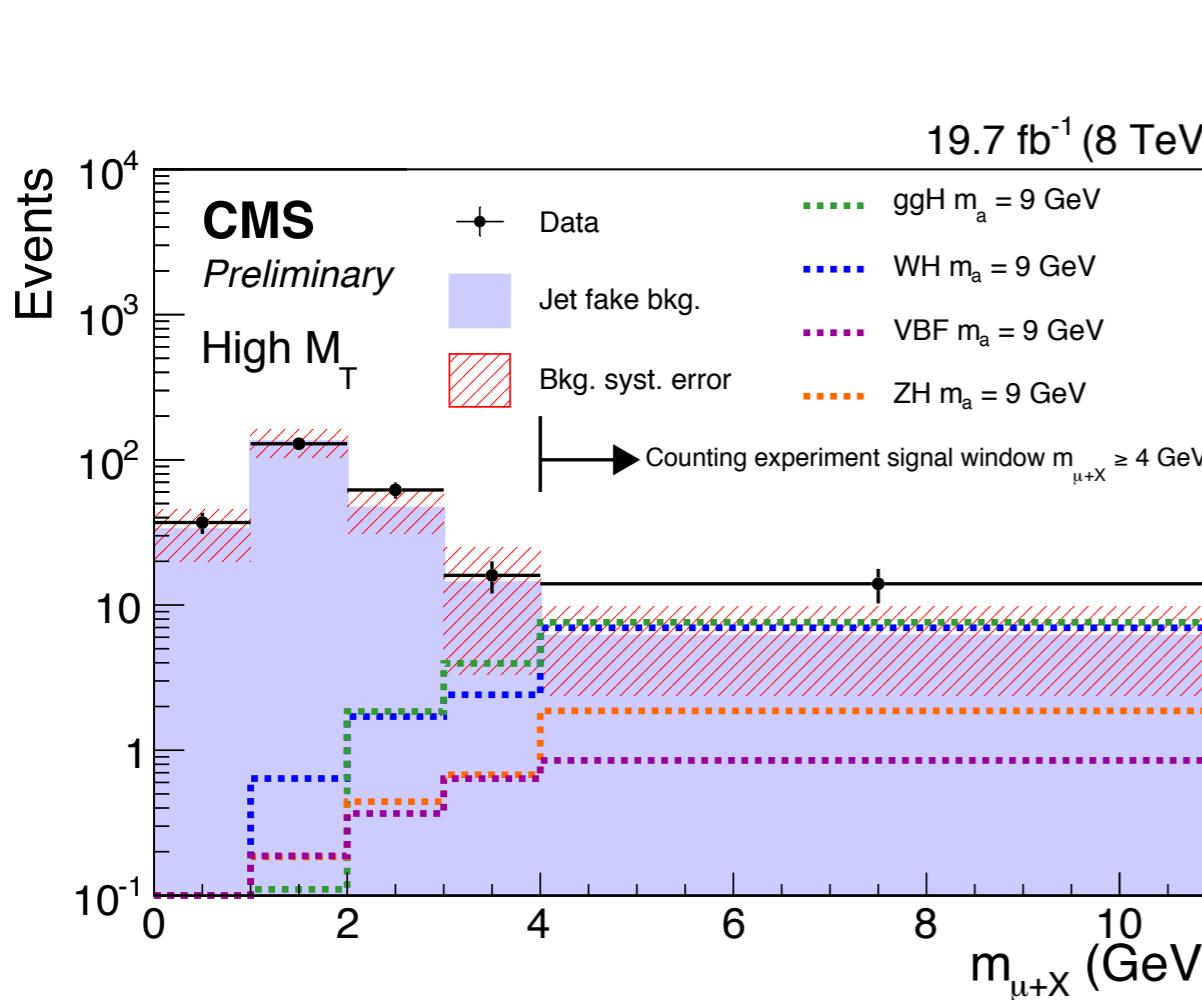

CMS PAS HIG-14-019

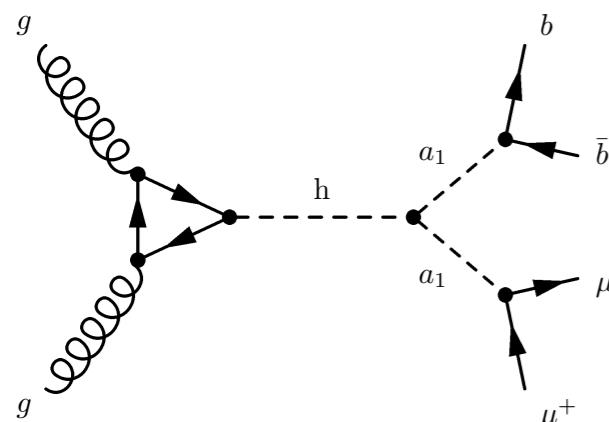

$h \rightarrow aa \rightarrow 4\tau$ (2)

- ◆ Different analysis strategy ($\tau_\mu \tau_x$ using HPS algorithm for hadronic tau)
 - ▶ including ggH, WH, ZH and VBF production modes of $h(125)$
 - ▶ higher mass region covered $m_a \in 5-15$ GeV
- ◆ No excess is found above the SM backgrounds
 - ▶ upper limits on $\text{Br}(h \rightarrow aa)\text{Br}(a \rightarrow \tau\tau)^2$ are set assuming SM cross-sections for all Higgs production modes

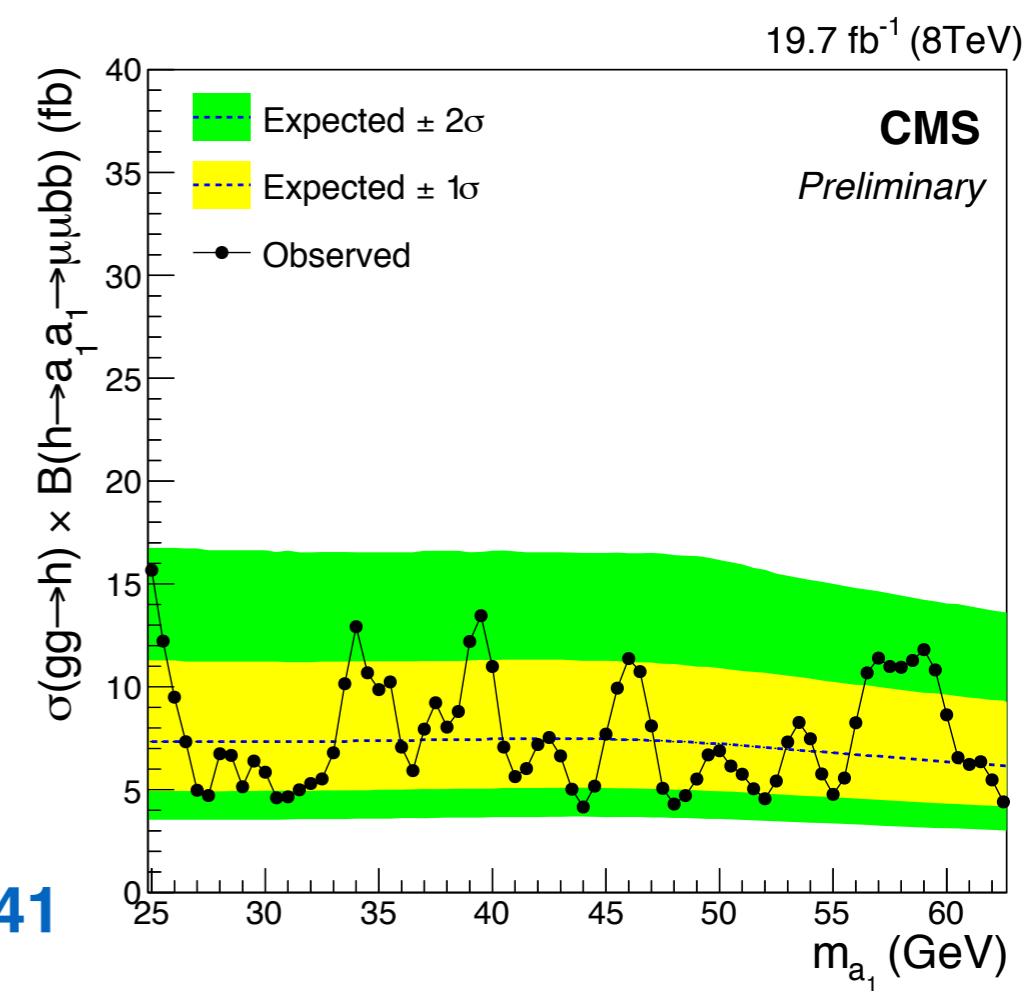

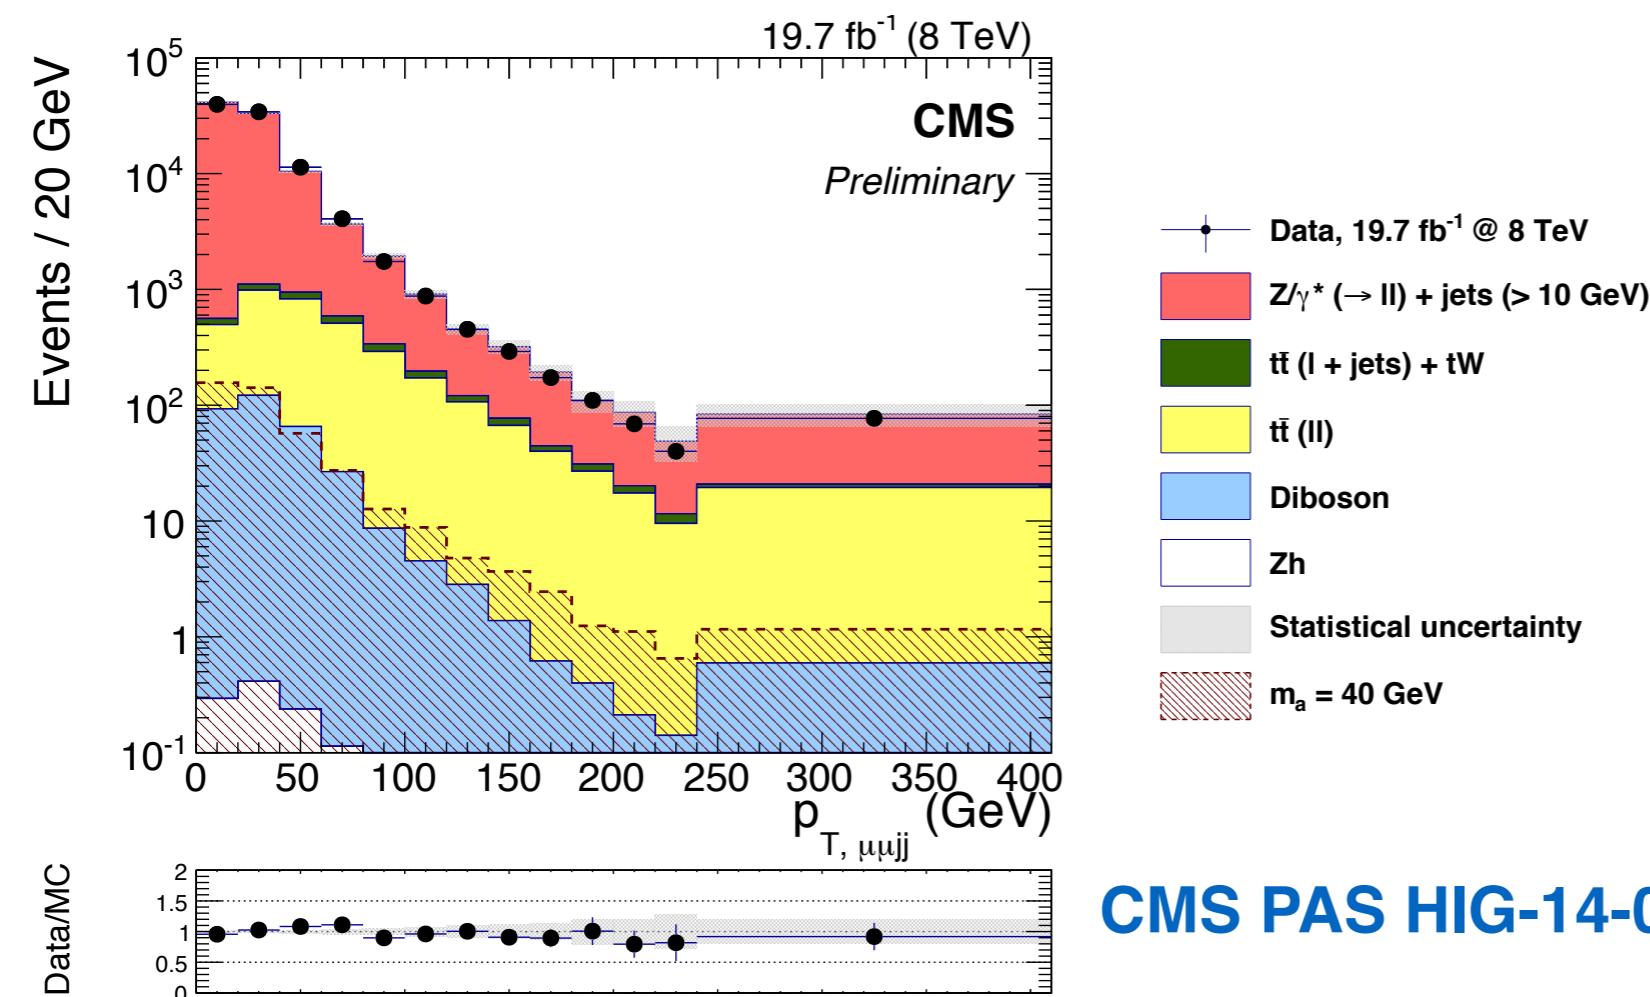

CMS PAS HIG-14-022

$h \rightarrow aa \rightarrow 2\mu 2b$

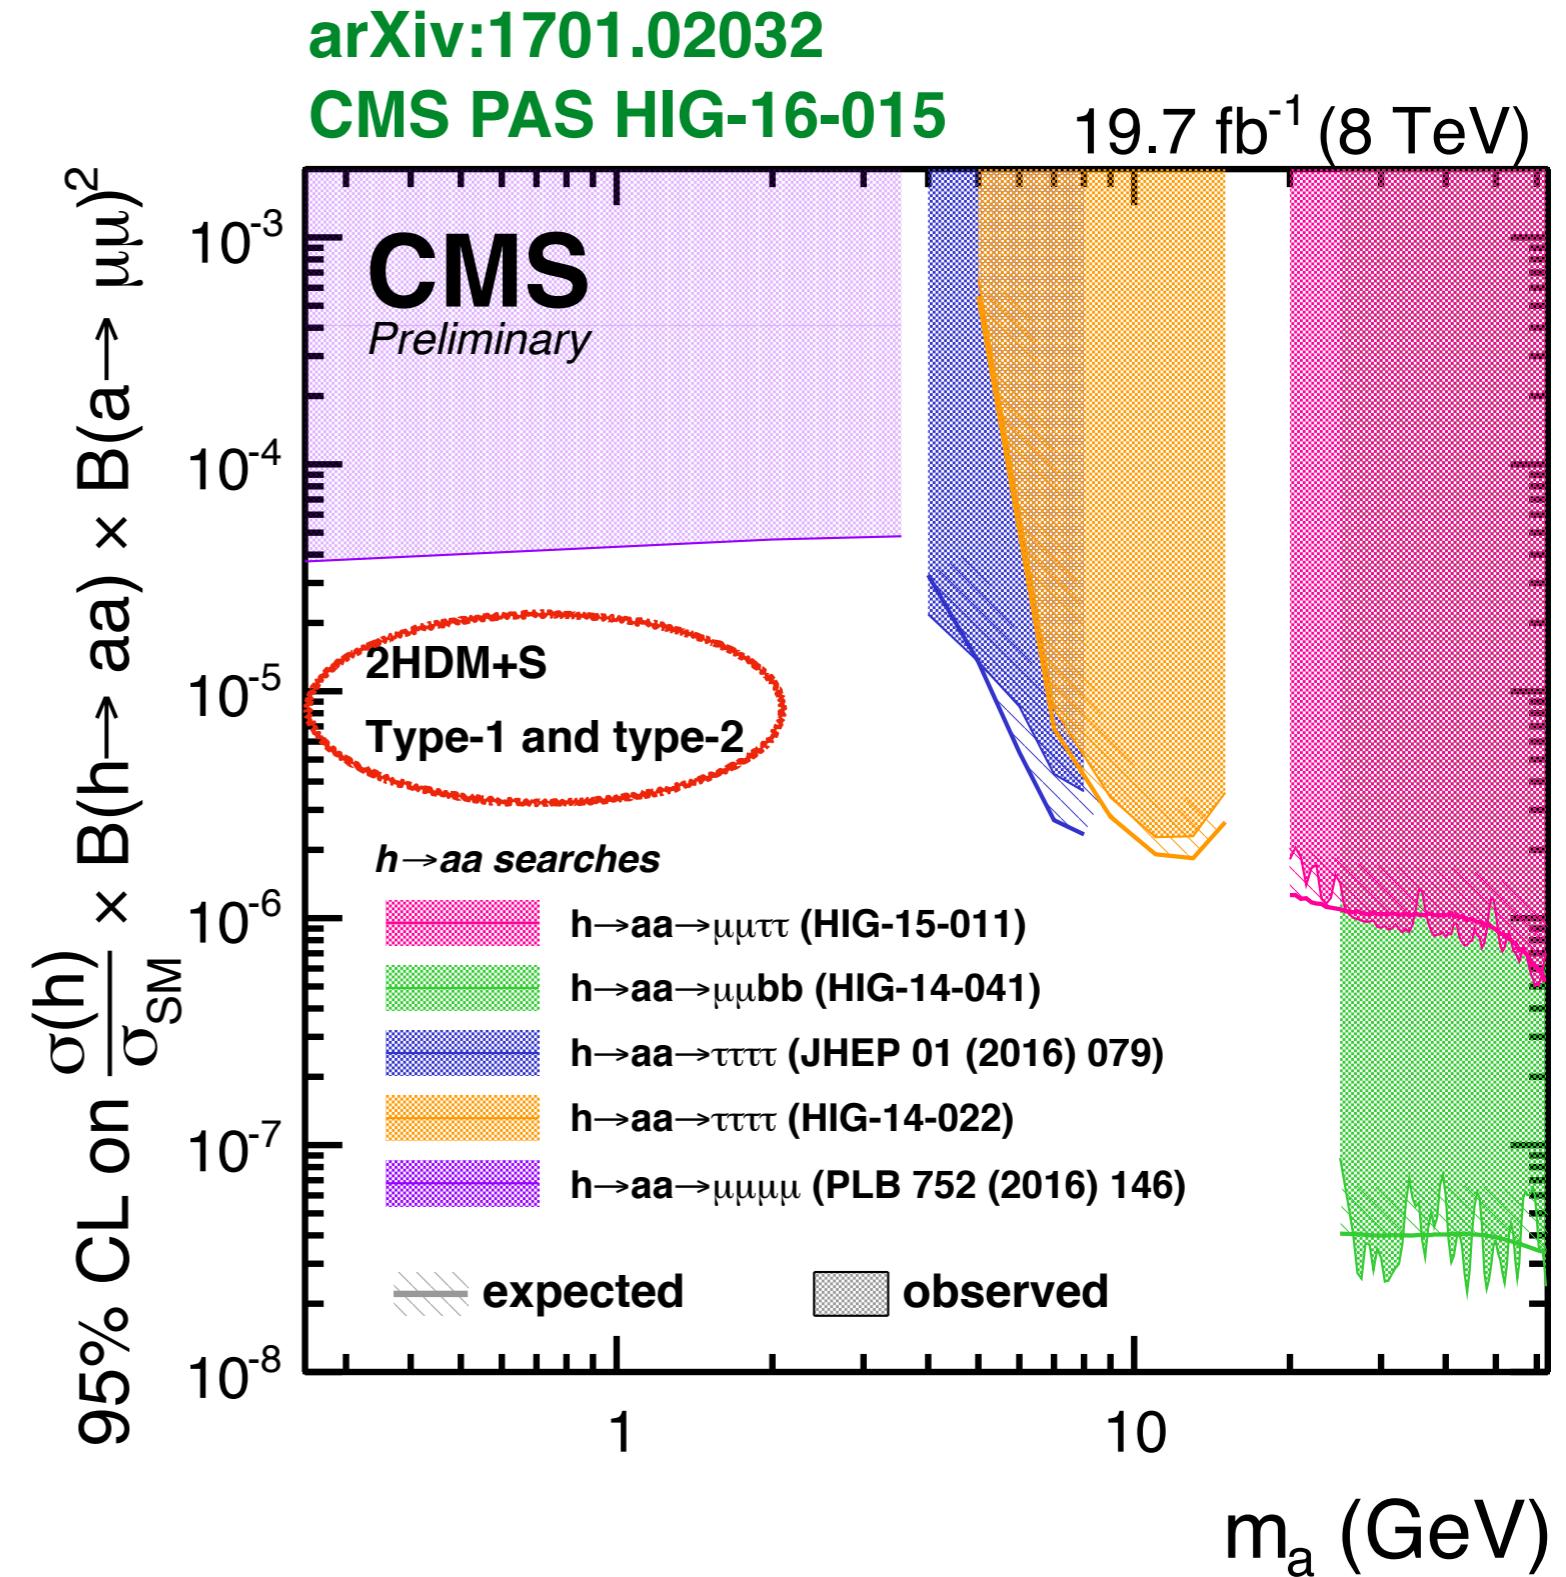

- ◆ Advantage of the higher rate and lower background contamination in comparison with the 4μ and $4b$ final states
- ◆ **No significant excess is observed**
 - ▶ upper limits are set on $\sigma_{ggF} \times \text{Br}(h \rightarrow aa \rightarrow \mu\mu bb)$ with $m_{\mu\mu}$ ranging between 4 to 12 fb for $m_{a_1} \in 25$ to 65 GeV

Overview of $h \rightarrow aa$

$$\frac{\Gamma(a \rightarrow \mu\mu)}{\Gamma(a \rightarrow \tau\tau)} = \frac{m_\mu^2 \sqrt{1 - (2m_\mu/m_a)^2}}{m_\tau^2 \sqrt{1 - (2m_\tau/m_a)^2}}.$$

- ❖ Upper limits from different $h \rightarrow aa$ searches in the context of “2HDM+S”
 - ▶ Type-1 and Type-2
 - ▶ quarkonia decays at 3, 5, 9, 11 GeV
 - ▶ all results from 8 TeV data

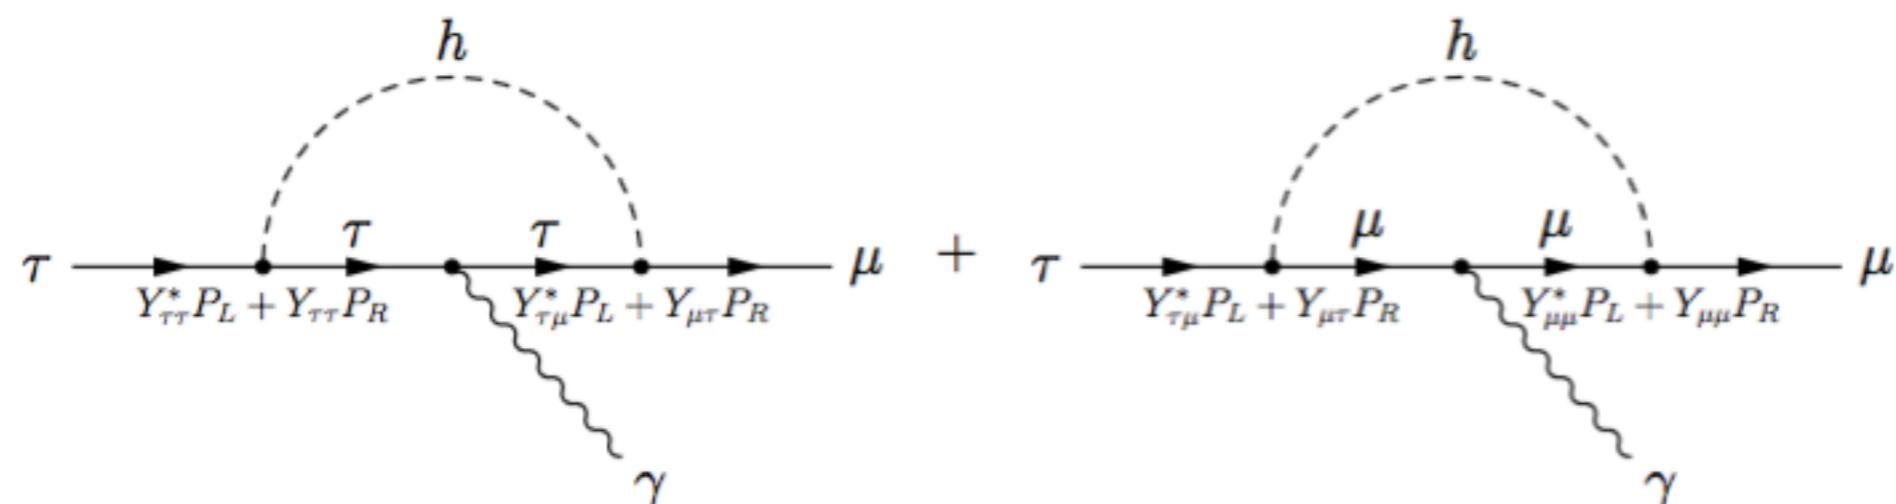

Lepton Flavor Violation

LFV Higgs Decays

- ◆ Forbidden in the SM, described by **composite Higgs** or **2HDM** models
- ◆ LFV Higgs couplings allow $\mu \rightarrow e$, $\tau \rightarrow \mu$, $\tau \rightarrow e$ to proceed via **a virtual Higgs boson**

- ◆ **Indirect constraints** to branching ratios of $h \rightarrow e\mu$, $h \rightarrow e\tau$, $h \rightarrow \mu\tau$ (theoretical approach described in JHEP **03** (2013) 26)
 - ▶ stringent constraints from $\mu \rightarrow e\gamma$, upper limit at 95% CL $\text{Br}(h \rightarrow \mu e) < O(10^{-8})$
 - ▶ bounds from $\tau \rightarrow \mu\gamma$ and $\tau \rightarrow e\gamma$ indirectly provide upper limit at 95% CL $\text{Br}(h \rightarrow \mu\tau)$ and $\text{Br}(h \rightarrow e\tau) < O(10\%)$

LFV $h \rightarrow e\mu, e/\mu\tau$

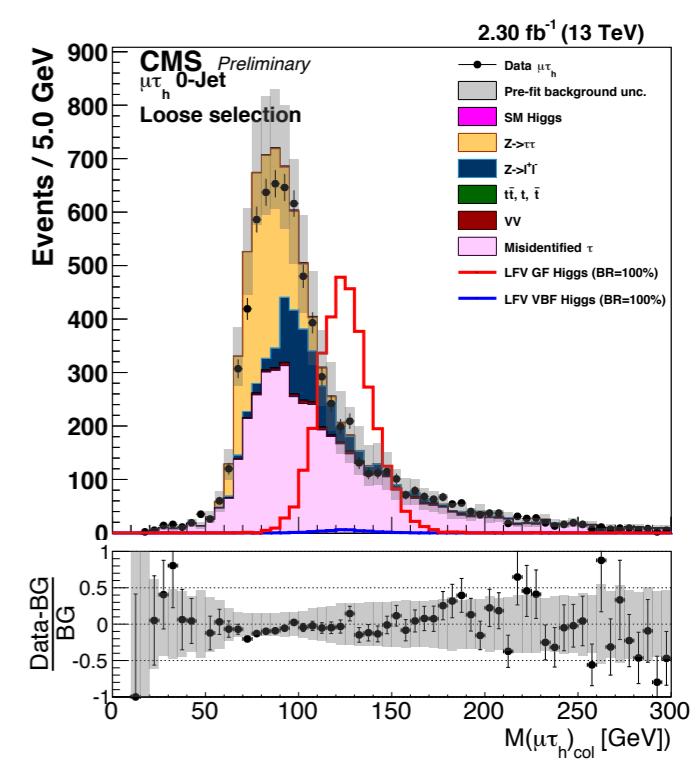

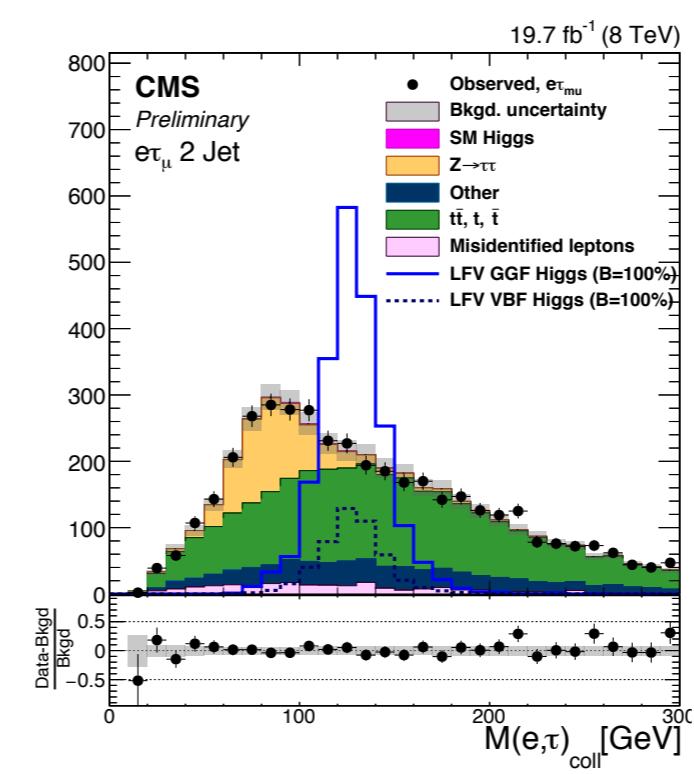

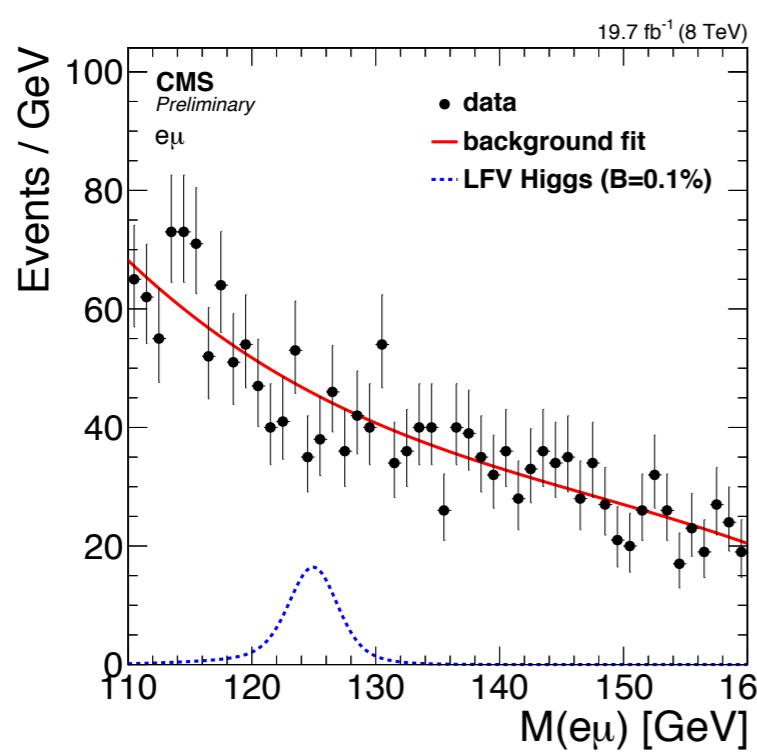

- ◆ Similar signature to the SM $h \rightarrow \tau\tau$ and $h \rightarrow \mu\mu$ searches but significant kinematic differences
- ◆ Provide direct constraints on the off-diagonal Higgs Yukawa couplings

$h \rightarrow e\mu$

- Very clean but branching ratio strongly constrained!
- 10 channels (barrel/endcap leptons mix with 0-1-2 jets)
- unbinned likelihood fit to $M_{e\mu}$ distribution

$h \rightarrow e\tau$ and $\mu\tau$

- 3 categories (0,1,2 jets) from τ_{had} and τ_{lep}
- large background leads to high systematic uncertainties
- binned likelihood fit to the distributions of M_{col} (m_h estimated with collinear approx.)

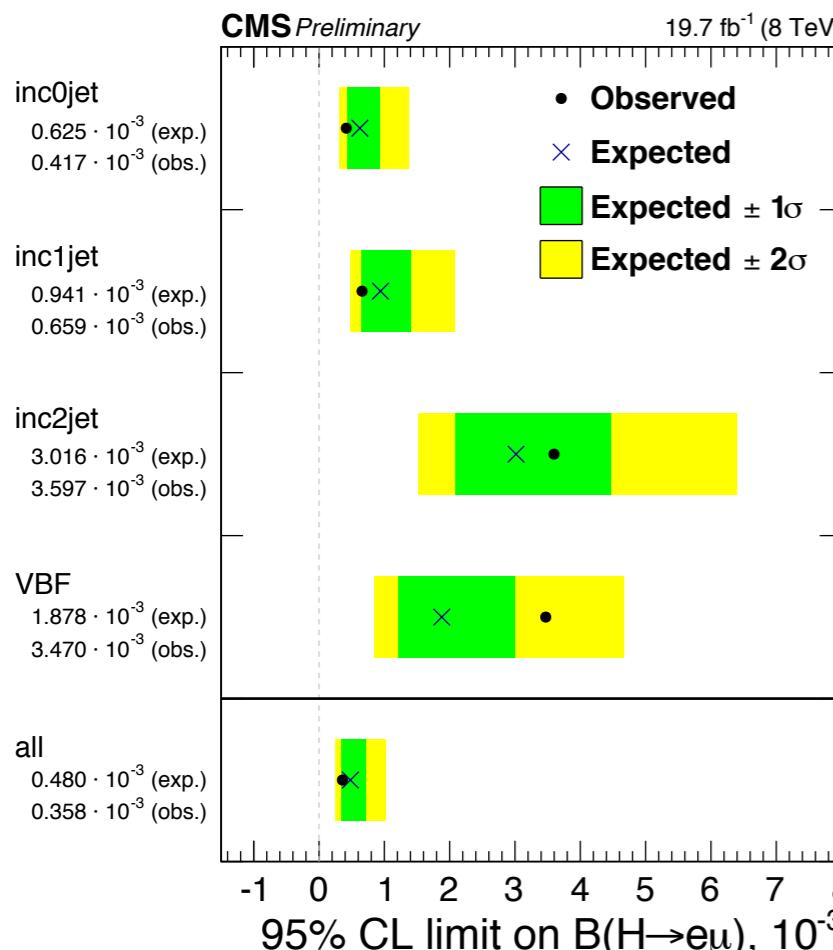

LFV $h \rightarrow e\mu, e/\mu\tau$

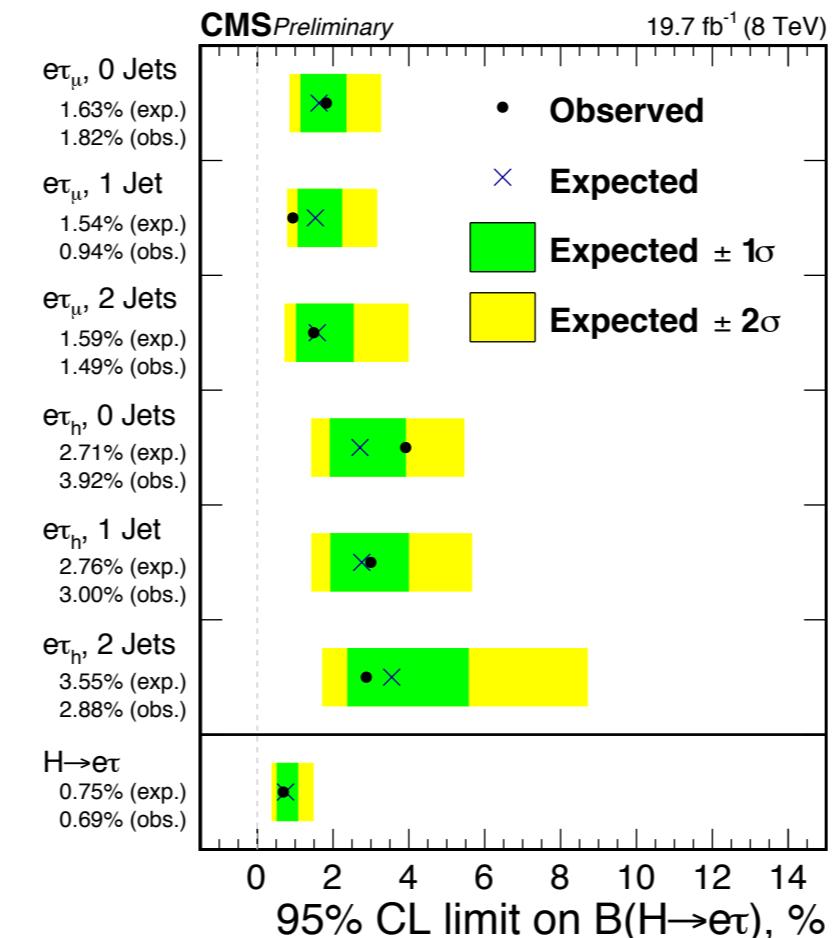

8 TeV 20 fb^{-1}

13 TeV 2.3 fb^{-1}

CMS PAS HIG-14-040

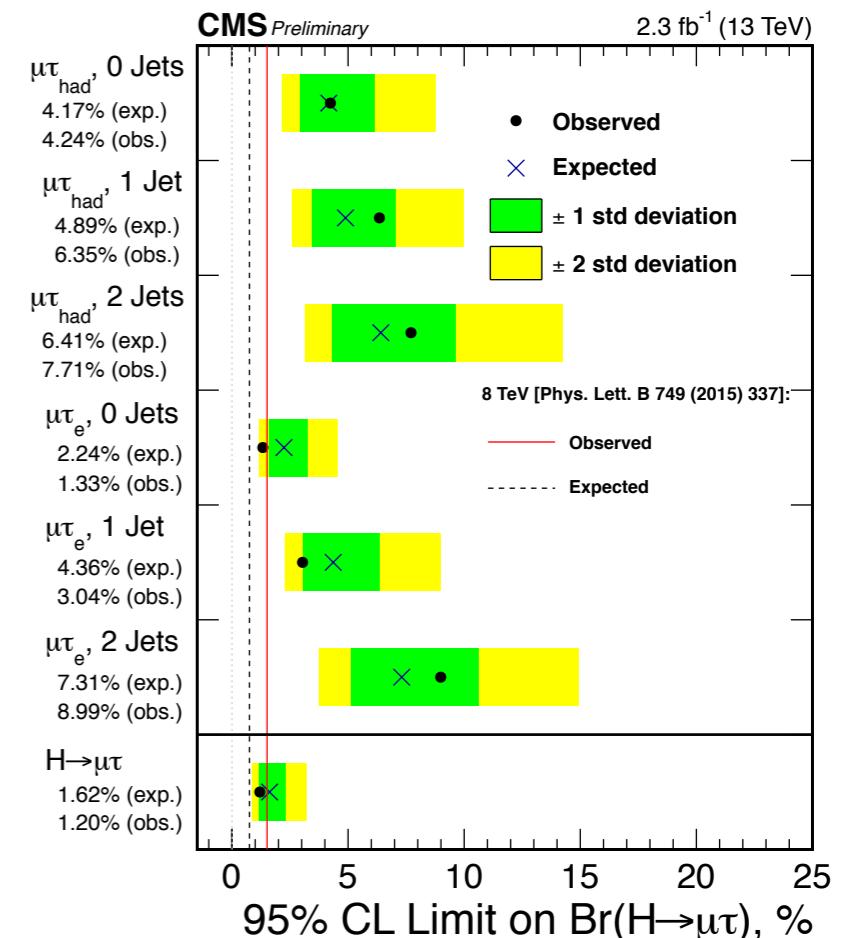

**$\text{Br}(h \rightarrow e\mu) < 0.035\%$
(0.048% expected)**

**$\text{Br}(h \rightarrow e\tau) < 0.69\%$
(0.75% expected)**

CMS PAS HIG-16-005

**$\text{Br}(h \rightarrow \mu\tau) < 1.20\%$
(1.62% expected)**

**No excess is observed
(2.4 σ at 8 TeV from $h \rightarrow \mu\tau$ not confirmed but comparable results)**

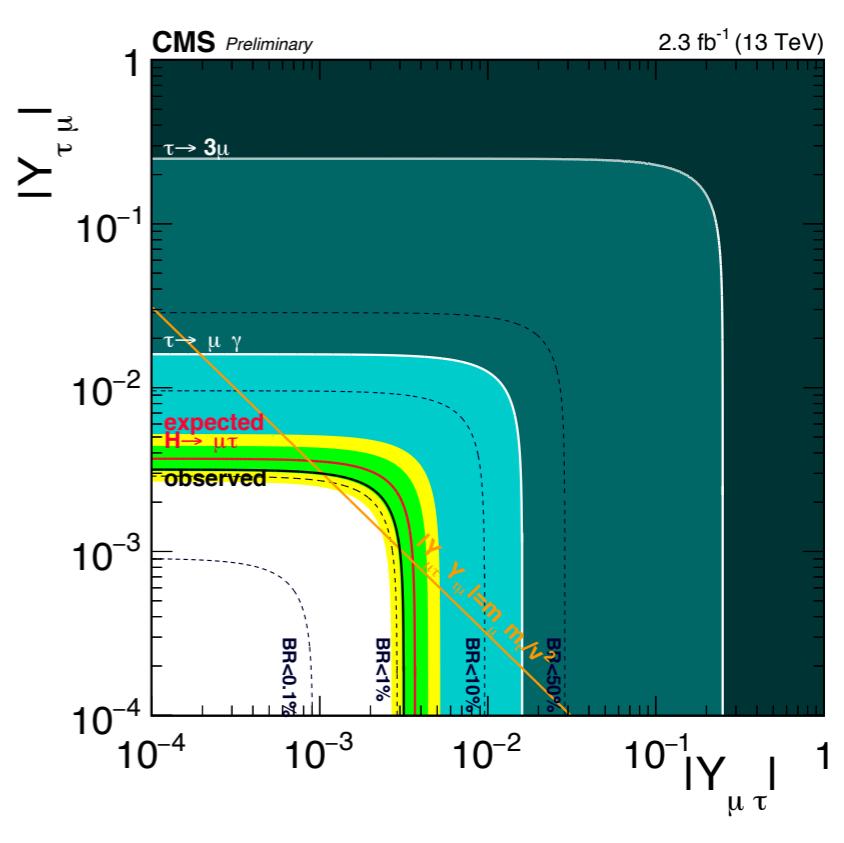

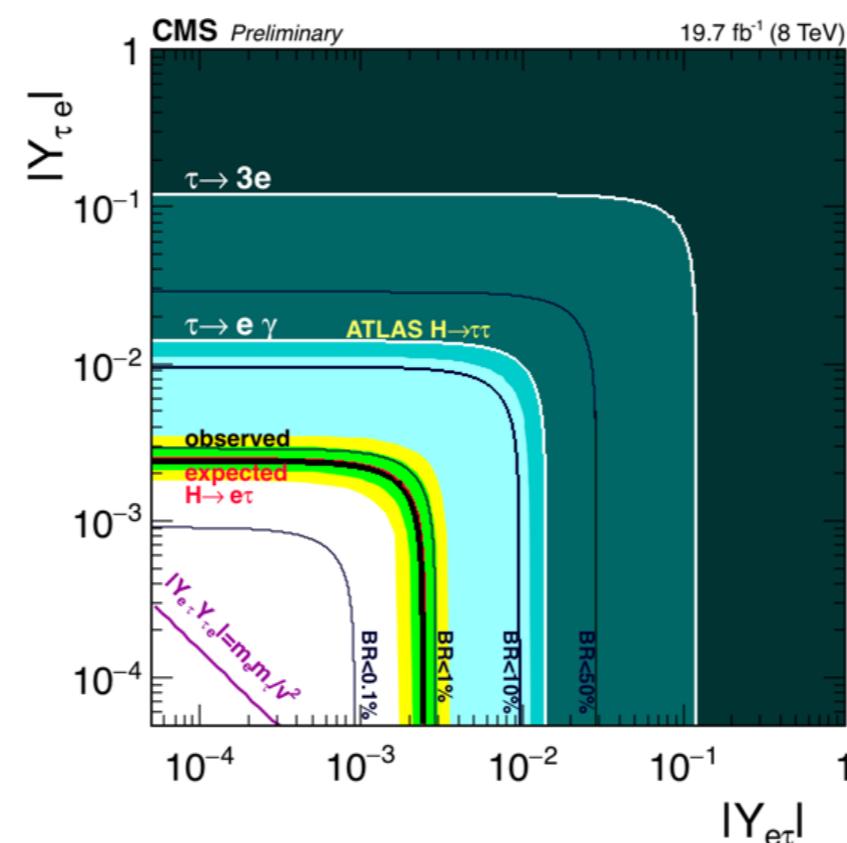

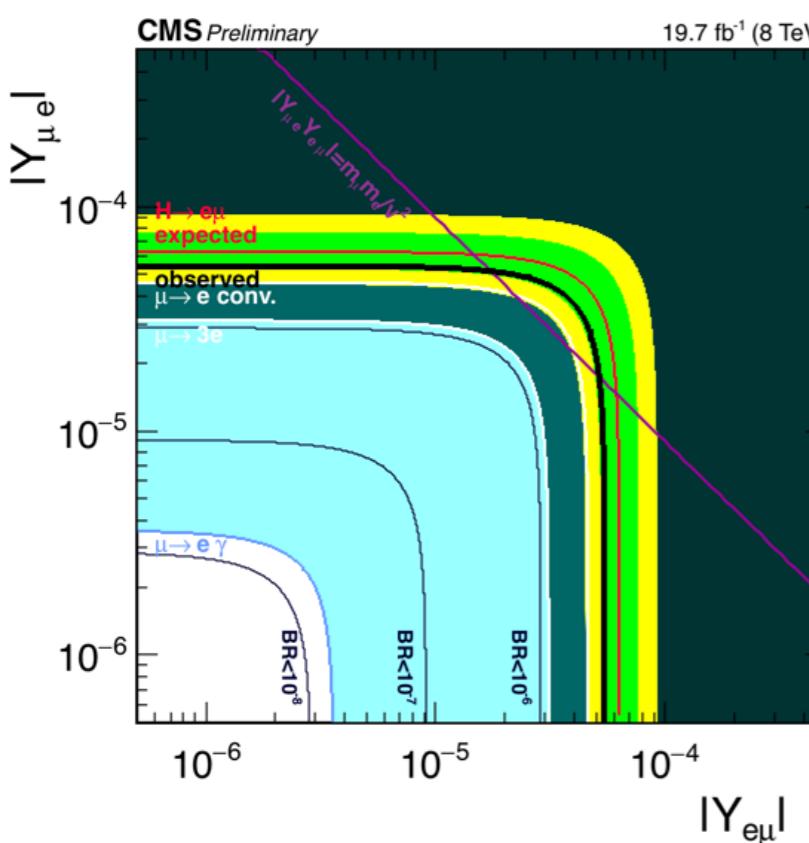

Higgs Yukawa Couplings

- The constraints on **$\text{Br}(h \rightarrow e\mu)$** , **$\text{Br}(h \rightarrow e\tau)$** and **$\text{Br}(h \rightarrow \mu\tau)$** can be bounded on the Higgs Yukawa couplings comparing to theoretical numbers*

$$h \rightarrow e\mu : \sqrt{|Y_{e\mu}|^2 + |Y_{\mu e}|^2} < 5.4 \times 10^{-4} (< 3.6 \times 10^{-6})$$

$$h \rightarrow e\tau : \sqrt{|Y_{e\tau}|^2 + |Y_{\tau e}|^2} < 0.0024 (< 0.014)$$

$$h \rightarrow \mu\tau : \sqrt{|Y_{\mu\tau}|^2 + |Y_{\tau\mu}|^2} < 0.0032 (< 0.016)$$

*R. Harnik, J. Kopp, and J. Zupan JHEP **03** (2013) 26

Summary

- ◆ The discovery of the SM-like Higgs boson opens an era of search for new physics
- ◆ $h(125) \rightarrow \text{invisible}$ searches at CMS shown the latest results from Run-2 at 13 TeV with 2.3 fb^{-1} and some new results with 12.9 fb^{-1} and their combinations
- ◆ $h(125) \rightarrow aa$ searches done in many channels and interpreted results in the context of 2HDM+S
- ◆ Direct searches for LFV $h(125)$ decays can constrain $\text{Br}(h \rightarrow \text{LFV})$ and set bounds on the off-diagonal Higgs Yukawa couplings
- ◆ Stay tuned! a lot more to come!
 - ▶ many more BSM results with full 2016 dataset (36 fb^{-1}) are on the way

Thanks for your attention!
