Central Exclusive Production at LHCb

Tuesday, 4 April 2017 10:10 (20 minutes)

The cross-section for central exclusive production of J/ψ and $\Psi(2S)$ mesons at 13 TeV is measured using the LHCb detector. Proton dissociative backgrounds are significantly reduced compared to previous measurements through the use of forward shower counters, recently installed for Run 2. Plans for future measurements are also presented to exploit the new Run2 dataset.
