Main goals of charm physics at BESIII

Leptonic and semileptonic decays of charmed mesons (D^0, D^+, D_s^+ and Λ_c^+) provide an ideal window to explore weak and strong effects

- **D leptonic decays**

  $f_{D(s)+}$, $f^{K(\pi)}_{+}(0)$: better calibrate LQCD

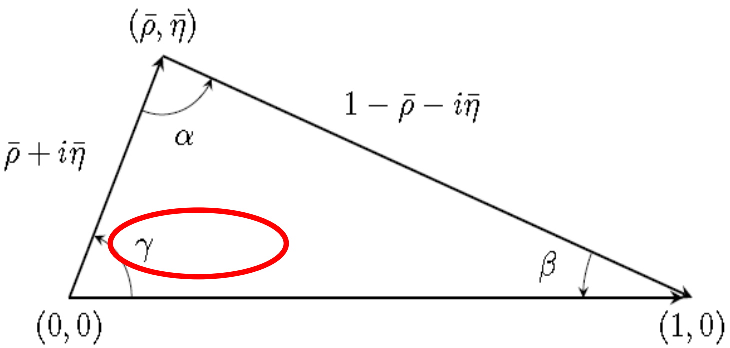
  $|V_{cs(d)}|$: better test on CKM unitarity

$$U = \begin{pmatrix} V_{ud} & V_{us} & V_{ub} \\ V_{cd} & V_{cs} & \boldsymbol{V_{cb}} \\ V_{td} & V_{ts} & V_{tb} \end{pmatrix}$$

- **D hadronic decays**

  $D^0\bar{D}^0$ mixing parameters and CP voilation

  Strong phase in D^0 decays: Constraint on γ/ϕ_3 measurement in B decays



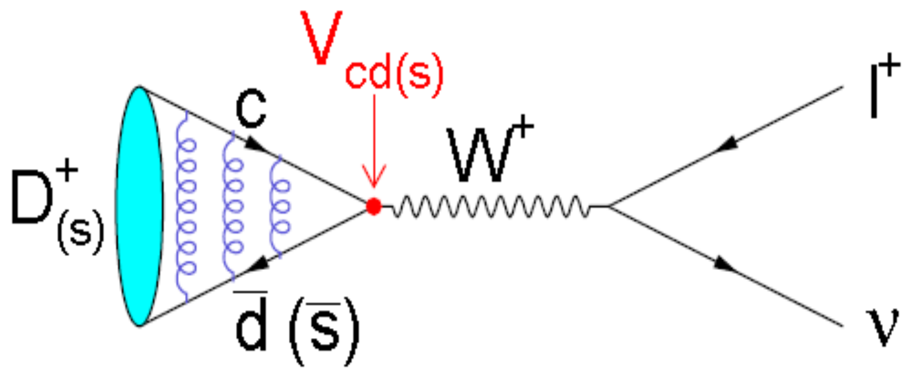
- **Rare D decays → New physics**

- **Absolute BFs of Λ_c^+**

  Before BESIII, no absolute BF measurements of Λ_c^+ using near threshold data, in the past 40 years

D leptonic decays

$D_{(s)}^+$ Leptonic Decays



In the SM:

$$\Gamma(D^+_{(s)} \to \ell^+\nu_\ell) = \frac{G_F^2 f^2_{D^+_{(s)}}}{8\pi}|V_{cd(s)}|^2 m_\ell^2 m_{D^+_{(s)}} \left(1 - \frac{m_\ell^2}{m^2_{D^+_{(s)}}}\right)^2$$

Bridge to precisely measure

- **Decay constant $f_{D(s)+}$ with input $|V_{cd(s)}|^{CKMfitter}$**
- **CKM matrix element $|V_{cd(s)}|$ with input $f^{LQCD}_{D(s)+}$**

Improved $B[D^+ \rightarrow \mu^+ \nu]$, f_{D+} and $|V_{cd}|$

$e^+e^- \rightarrow \psi(3770) \rightarrow D^+D^-$

2.93 fb^{-1} data@ 3.773 GeV

$N_{D^-_{tag}} = (170.31 \pm 0.34) \times 10^4$

$B[D^+ \rightarrow \mu^+ \nu] = (3.71 \pm 0.19 \pm 0.06) \times 10^{-4}$

Input t_{D+}, m_{D+}, $m_{\mu+}$ on PDG and $|V_{cd}|$ of CKM-Fitter

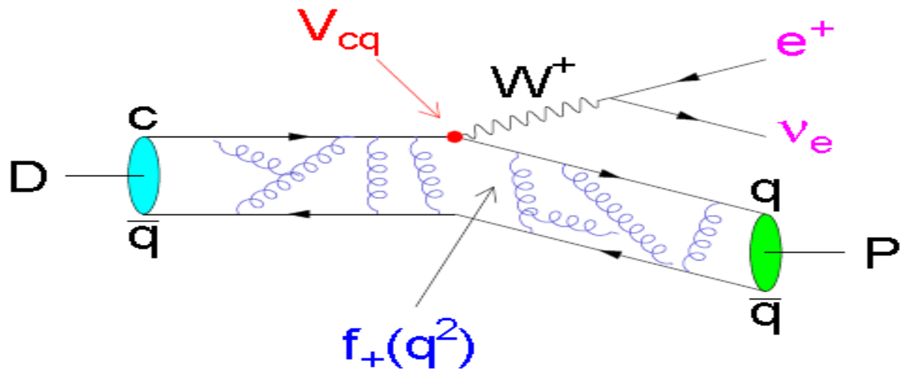
$f_{D+} = (203.2 \pm 5.3 \pm 1.8)$ MeV

BESIII

Input t_{D+}, m_{D+}, $m_{\mu+}$ on PDG and LQCD calculated $f_{D+}=207\pm4$ MeV[PRL100(2008)062002]

$|V_{cd}| = 0.2210 \pm 0.0058 \pm 0.0047$

Semi-leptonic Decay $D^0 \to K(\pi)^- e^+ \nu$



Differential rates: $$\frac{d\Gamma}{dq^2} = X \frac{G_F^2 |V_{cd(s)}|^2}{24\pi^3} p^3 |f_+(q^2)|^2$$

Bridge to precisely measure:

- **Form factors $f_+^{D\to K(\pi)}(0)$ with input $|V_{cd(s)}|^{CKMfitter}$**
  - Single pole form
  $$f_+(q^2) = \frac{f_+(0)}{1 - \frac{q^2}{M_{\rm pole}^2}}$$
  - Modified pole model
  $$f_+(q^2) = \frac{f_+(0)}{(1 - \frac{q^2}{M_{\rm pole}^2})(1 - \alpha \frac{q^2}{M_{\rm pole}^2})}$$
  - ISGW2 model
  $$f_+(q^2) = f_+(q^2_{\rm max}) \left(1 + \frac{r^2_{\rm ISGW2}}{12}(q^2_{\rm max} - q^2)\right)^{-2}$$
  - Series expansion model
  $$f_+(t) = \frac{1}{P(t)\Phi(t,t_0)} a_0(t_0) \left(1 + \sum_{k=1}^{\infty} r_k(t_0)[z(t,t_0)]^k\right)$$
- **CKM matrix element $|V_{cs(d)}|$ with input $f_+^{LQCD, D\to K(\pi)}(0)$**

$D^0 \to K(\pi)^- e^+ \nu \to f_+^{D\to K(\pi)}(q^2)|V_{cs(d)}|$

Search for $D^+ \to D^0 e^+ \nu$

In SM, $D^0 \bar{D}^0$ mixing, CP violation and rare decay of charm are small

$D^0\bar{D}^0$ mixing $\quad x \approx y \approx 10^{-3} \Rightarrow r_D = [x^2 + y^2]/2 \approx 10^{-6}$

CP violation asymmetries $\sim 10^{-3}$

Rare decays $\leq 10^{-6}$

Applying the SU(3) symmetry for the light quarks, this rare decay branching fraction can be predicted by theoretical calculation and its theoretical value is 2.78×10^{-13} [EPJC, 59:841-845(2009)].

quoted from Derrick's talk given at APS2014

The $\mathcal{B}(D^0 \rightarrow K^-\pi^+)$ has been corrected by the PDG value of $\mathcal{B}(D^0 \rightarrow K^+\pi^-)$.

For $D^0 \rightarrow K_S^0\eta$, $D^+ \rightarrow \pi^0\pi^+$, $D^+ \rightarrow \eta\pi^+$, $D^+ \rightarrow \eta'\pi^+$, $D^+ \rightarrow K_S^0\pi^+$ and $D^+ \rightarrow K_S^0K^+$, it shows better precision than the present values.

- The study of the hadronic decays of charmed *D* mesons is of great significance in the study of the strong and weak interactions in *D* decays.
- The analysis on $D \rightarrow PP$ modes will provide materials for the study of SU(3) breaking effect[1] . And the observation of CP violation in D decay is commonly believed to be indications of new physics.
- $D^0 \rightarrow K^-\pi^+$ is an important normalization mode.
- Most of the D decays have been studied by CLEO in 2010[2] , other measurements come from Belle[3] , BaBar[4] and CDF[5] , etc.
- Some of the branching fractions (BFs) are not well established. With the 2.93 fb^{-1} data taken at 3.773 GeV within BESIII , the results will help to improve these measurements.

Λ_c^+ decays

Absolute BFs of Λ_c^+ decays

- Λ_c^+ was observed in 1979

- **Before 2014, all decays of Λ_c^+ are measured relative to $\Lambda_c^+ \to pK^-\pi^+$, which suffer large error of 25%, with high energy data. No absolute measurement using data produced at Λ_c^+ pair threshold**

- **Sum of BFs of known decays Λ_c^+ is only about 60%**

- **In 2014, Belle reported improved measurement of $B[\Lambda_c^+ \to pK^-\pi^+]$, with a precision of ~5%**

$$B[\Lambda_c^+ \to \Sigma^-\pi^+\pi^+\pi^0] = (2.11 \pm 0.33)\%$$ **[First observation]**

where the errors are statistical only. The sources of the systematic errors arise mainly from the systematic uncertainties in PID, tracking, π^0 efficiency, fitting, MC statistics and number of $\bar{\Lambda}_c^-$ tags. The total systematic errors are estimated to be about 5%.

The measured branching fraction for $\Lambda_c^+ \to \Sigma^-\pi^+\pi^+$ is consistent with and more precise than $B[\Lambda_c^+ \to \Sigma^-\pi^+\pi^+] = (2.3 \pm 0.4)\%$ in PDG2015.

Summary

- With 2.93, 0.482, 0.567 fb^{-1} data taken at 3.773, 4.009 and 4.6 GeV, BESIII have studied leptonic related and hadronic decays of D, first measurement of the absolute BFs of Λ_c^+

- Improved measurements of decay constant f_{D+} and form factor $f_+^{D\to K(\pi)}(q^2)$, which are important to test and calibrate LQCD calculations

- Improved measurements of CKM matrix element $|V_{cs(d)}|$, which are important to test the CKM matrix unitarity

- Preliminary of strong phase in $D^0 \to K_S\pi^+\pi^-$

- More results with better precision are expected with more data

- About 3 fb^{-1} data at 4.18 GeV has been taken in 2016, measurement of f_{Ds+} and $|V_{cs}|$ by $D_s^+ \to l^+v$, FF studies of $D_s^+ \to \eta^{(')}e^+v$ are expected in the near future

Observation of $\Lambda_c^+ \rightarrow nK_S\pi^+$

involving a neutron. Under the isospin symmetry, its amplitude is related to those of the most favored proton modes $\Lambda_c^+ \rightarrow pK^-\pi^+$ and $\Lambda_c^+ \rightarrow p\bar{K}^0\pi^0$ as $\mathcal{A}(n\bar{K}^0\pi^+) + \mathcal{A}(pK^-\pi^+) + \sqrt{2}\mathcal{A}(p\bar{K}^0\pi^0) = 0$. Hence, precise measure-

[2,3]. In the three-body Λ_c^+ decay to $N\bar{K}\pi$, the total decay amplitudes can be decomposed into two isospin amplitudes of the $N\bar{K}$ system as isosinglet ($I^{(0)}$) and isospin-one ($I^{(1)}$). In the factorization limit, the color-allowed tree diagram, in which the π^+ is emitted and the $N\bar{K}$ is an isosinglet, dominates $I^{(0)}$, and $I^{(1)}$ is expected to be small compared to $I^{(0)}$ as it can only proceed through the color-suppressed tree diagrams. Though the factorization scheme is spoiled in

Prospects on $f_{D(s)+}$, $f^{K(\pi)}_{+}(0)$, $|V_{cs(d)}|$ and Λ_c^+

- Precision of the LQCD calculations of f_{D+}, f_{Ds+}, f_{D+}:f_{Ds} is 0.5%, 0.5% and 0.3%. Measurements of $f_{D(s)+}$ and $|V_{cs(d)}|$ by $D_{(s)}^+ \rightarrow l^+v$ are still statistically limited. More 10 fb^{-1} data near 3.773/4.18 GeV will help to improve precision to 1% level
- Measurements of $|V_{cs(d)}|$ by $D \rightarrow K(\pi)e^+v$ is restricted by precision of LQCD calculation 2.4(4.4)%. Improved theoretical calculation will be very helpful
- Measurements of $f^{\pi}_{+}(0)$ by $D \rightarrow \pi e^+v$ is still statistics limited. More 10 fb^{-1} data at 3.773 GeV can improve precision to 1% level
- In addition, with more 3 fb-1 data in 4.6-4.65 GeV will help to improve $B[\Lambda_c^+ \rightarrow pK^-\pi^+]$ to 2% level and explore FF in $\Lambda_c^+ \rightarrow \Lambda l^+v$ decays
