

JUAS 2017 – RF Exam

$$\mu = \mu_0 \mu_r$$

$$\mu_0 = 4\pi \cdot 10^{-7} \text{ Vs/(Am)}$$

$$\varepsilon = \varepsilon_0 \varepsilon_r$$

$$\varepsilon_0 = 8.854 \cdot 10^{-12} \text{ As/(Vm)}$$

$$c_0 = 3 \cdot 10^8 \text{ m/s}$$

Name: _____ Points: _____ of 20 (25 with bonus points)

Utilities: JUAS RF Course 2017 lecture script, personal notes,
pocket calculator, ruler, compass, and your brain!

(No cell- or smartphone, no iPad, laptop, or wireless devices, no text books or any other tools!!!)

Please compute and **write your results clear and readable**, if appropriate on a separate sheet of paper. Any unreadable parts are considered as wrong.

1. “Brick-style” Cavity

(5 points)

Design a “brick”-shaped, rectangular cavity with relative dimensions $c = 0.7 \cdot a$ and $a/b = 2$, operating at the fundamental mode of 500 MHz.

- Of what type is the fundamental mode? (½ point)
- What are the physical dimensions a , b and c of the cavity? (1½ points)
Hint: Free-space wavelength and frequency are linked through the speed-of-light: $\lambda_0 = \frac{c_0}{f}$
- What is the (unloaded) Q -value of the cavity if it is made out of copper? (1 point)
($\sigma_{Cu} = 58.5 \cdot 10^6 \text{ S/m}$)
- Determine the Q -value if the cavity is made out of stainless steel. (½ point)
($\sigma_{SS} = 1.35 \cdot 10^6 \text{ S/m}$)
- What are the mode types and frequencies of the next two higher order modes? (1½ points)

2. Smith chart

(5 points)

- a) Indicate points $P_1 \dots P_6$ in the Smith chart, assuming a reference impedance $Z_0 = 50 \Omega$.
From the Smith chart, determine the missing Z or Γ , and complete the table. (1 point)
(Use the provided Smith chart)

Point no.	P_1	P_2	P_3	P_4	P_5	P_6
Z / Ω	∞		0		$50 + j 50$	$50 - j 100$
Γ		0		$0.7 \angle -62^\circ$		

- b) Draw the locus of $|\Gamma| = 0.5$ in the Smith chart. (½ point)

- c) Points P_5 and P_6 represent a complex load impedance Z_{load} .
Indicate the normalized z_{load} in the Smith chart, and look up

- the reflection coefficient, (½ point)
- the (voltage) standing wave ratio, (½ point)
- the return loss (in dB), (½ point)
- the reflection loss (in dB) (½ point)

again, assuming a reference impedance of $Z_0 = 50 \Omega$.

(Hint: Use a ruler to determine $|\Gamma|$ of z_{load} , and compare it with value found at the “radially scaled parameters” Smith chart ruler at the bottom.)

- d) With a simple loss-less matching circuit, a single reactive element, the complex loads represented by points P_5 and P_6 (two independent cases!) can be matched to the reference impedance of $Z_0 = 50 \Omega$.

- Indicate the matching as graph in the Smith chart. (½ point)
- Sketch the matching circuit. (½ point)
- Evaluate the element value, assuming an operation frequency of $f = 500 \text{ MHz}$. (½ point)

3. S-Parameters

(2 points)

Match the ideal S-parameters in matrix form to the corresponding components.

$$S_A = \begin{bmatrix} 0 & 0.5 & 0.5 \\ 0.5 & 0 & 0.5 \\ 0.5 & 0.5 & 0 \end{bmatrix} \quad S_B = \begin{bmatrix} 0 & \frac{j}{\sqrt{2}} & \frac{1}{\sqrt{2}} & 0 \\ \frac{j}{\sqrt{2}} & 0 & 0 & \frac{1}{\sqrt{2}} \\ \frac{1}{\sqrt{2}} & 0 & 0 & \frac{j}{\sqrt{2}} \\ 0 & \frac{1}{\sqrt{2}} & \frac{j}{\sqrt{2}} & 0 \end{bmatrix} \quad S_C = \begin{bmatrix} 0 & -1 \\ -1 & 0 \end{bmatrix} \quad S_D = \begin{bmatrix} 0 & 0 \\ 1 & 0 \end{bmatrix}$$

a) Assign the S-matrices (S_A ... S_D) to the components:

(1 point)

component	... dB directional coupler	transmission line, electrical length = $\lambda/...$	resistive power divider	isolator
S-matrix				

b) Fill the missing dB (coupler) and λ (transmission-line) information (...).

(1 point)

4. Multiple choice

(5 points)

Tick **one** correct answer like this: .

- Using an electromagnetic simulation software, the mesh cells in regions with electric field concentration should be made: (½ point)
 - smaller
 - larger
 - doesn't matter
- A sinusoidal RF signal is measured with an oscilloscope, having an internal 50 Ω termination. The cursors display a peak-to-peak voltage of 500 mV. What is the signal power in dBm? (½ point)
 - 1 dBm
 - 2 dBm
 - +4 dBm
- For a "E" (or "TM") mode, the following is true: (½ point)
 - Its magnetic field has only transverse components
 - Its magnetic field has transverse and longitudinal components
 - Its electric field has only transverse components

4. Changing the height h of a cylindrical cavity operating on the TM_{110} dipole-mode will **NOT** change: (½ point)
- its resonant frequency
 - its quality factor
 - its R/Q
5. The GSM standard specifies a minimum sensitivity requirement of -100 dBm for the signal reception, while the output power of the cell phone transmitter is typically in the order of 1 W. This corresponds to how many orders of magnitude in power? (½ point)
- 5
 - 10
 - 13
6. A 4-port directional coupler has 10 dB coupling and 20 dB directivity. What is the relative level between the desired coupled output and the input signal? (½ point)
- -10 dB
 - +20 dB
 - -30 dB
7. In a RF accelerating cavity, the transit time factor expresses: (½ point)
- The time it takes for the energy to transfer from the electric field to the magnetic field
 - The time variation of the accelerating field during the bunch passage
 - The time it takes the bunch to travel through the cavity
8. Examples of TEM transmission lines are: (½ point)
- Waveguides operating below cut-off frequency
 - Coaxial cables
 - Resonant cavities with input and output coupler
9. Critical coupling (impedance match at resonance) between resonator and generator occurs at (½ point)
- $Q_L = Q_{ext}$
 - $Q_L = Q_0/2$
 - $Q_L = 2 \cdot Q_0$
10. A network analyser is used to (½ point)
- Analyse signals in the frequency domain
 - To characterize the S-parameters of an RF element (DUT = device under test)
 - Measure and calibrate signals from the internet communication structure.

5. Skin-Effect

(3 points)

A beam pipe with circular cross-section is given. It has a diameter of 10 cm and is made out of copper ($\sigma_{Cu} = 58.5 \cdot 10^6$ S/m), with a wall thickness of 2 mm.

- Determine the skin depth at $f = 1$ GHz. Determine the real part of the impedance per meter at this frequency. (1½ points)
(Hint: This is the surface resistance as defined for lossy coaxial cables.)
- Now assume the beam pipe is made from a stainless steel, which has a 43 times higher bulk resistivity compared to copper. (½ point)
What are the skin depth and the surface resistance (= resistance per unit square) now?
- At which frequency (case: stainless steel) the wall thickness equals the skin depth? (1 point)

6. "Pillbox" Cavity

(5 bonus points)

Analyze a simple cylindrical "pillbox" cavity (the beam-pipe ports are neglected). The cavity is made out of copper ($\sigma_{Cu} = 58.5 \cdot 10^6$ S/m), has a dimension ratio $h/a = 0.2$ (a = radius, h = height), and operates at 200 MHz for the fundamental mode ($TM_{010} = E_{010}$).

- Calculate the R/Q of the cavity! (½ point)
- What is the radius a of this resonator? (½ point)
- Determine the lumped elements R , L , and C of the equivalent parallel R-C-L circuit. (1½ points)
- Now assume that this cavity is made from a stainless steel, which has a 43 times higher resistivity than copper. For the same geometrical dimensions, re-compute the resonance frequency, R/Q , and the unloaded Q-value. Which values of the parallel equivalent circuit has changed? (1½ points)
- The copper cavity is now scaled to a resonance frequency of 100 MHz. Indicate the scaling ratio of all linear dimensions. What is the new Q-value? (1 point)
