

Introduction to MAD-X

G. Sterbini, CERN

Inspired by W. Herr's material

23 January 2017, Archamps

`guido.sterbini@cern.ch`

THE MAD-X LECTURES

We will have

- ▶ **1 h lecture** (now).
- ▶ **6 h "hand-on" tutorials during the week.**
 - ▶ Tomorrow's tutorials (2×1 h) will be dedicated to get familiar with the MADX environment, to prepare a very simple input file and to explore a FODO cell
 - ▶ On Thursday's tutorial (2×1 h) will be devoted to the FODO lattice and the chromaticity.
 - ▶ On Friday's tutorial (2×1 h) we will play with transfer lines and the LHC lattice.

Each tutorial is split in two parts of ≈ 20 min each (last 20 minutes for Q&A). Basic knowledge of Linux is assumed but do not hesitate to ask in case: **we (Guido, Dario, Andrea and Hector) are here to help.**

MAD-X IN <60M:00s!

Introduction

MAD-X syntax

“Hello World!” example

DISCLAIMER. This material is intended to be an introduction to MAD-X: a large part of the code capabilities are not discussed in details or are not discussed at all! **We will use MAD-X to “visualise” the transverse dynamics concepts. The main goal here is to help you to be exposed to the beam dynamics from a new perspective.**

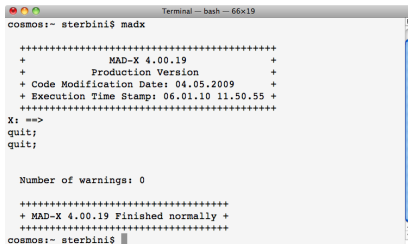

If you want to deepen the subject you can find a lot of material on the web (i.e., here¹)...

- ▶ googling “**madx**”, you get the MAD-X homepage.
- ▶ To wet your appetite, you can google “MAD-X primer”.
- ▶ To go in details, you can google “MAD-X manual”.

¹<http://madx.web.cern.ch/madx/releases/last-dev/madxuguide.pdf>

WHAT IS MAD-X?

- ▶ A general purpose beam optics and lattice program distributed for free by CERN.
- ▶ It is used at CERN since more than 20 years for machine design and simulation (PS, SPS, LHC, linacs...).
- ▶ MAD-X is written in C/C++/Fortran77/Fortran90 (source code is available under CERN copyright).

```

```

A GENERAL PURPOSE BEAM OPTICS CODE

MAD-X is

- ▶ **multiplatforms** (Linux/OSX/WIN...),
- ▶ very **flexible** and easy to extend,
- ▶ made for complicated applications, **powerful** and rather complete,
- ▶ mainly designed **for large projects** (LEP, LHC, CLIC...).

MAD-X is **NOT**

- ▶ a program for teaching,
- ▶ (very) easy to use for beginners,
- ▶ coming with a graphical user interface.

IN LARGE PROJECTS (E.G., LHC):

- ▶ Must be able to handle machines with $\geq 10^4$ elements,
- ▶ many simultaneous MAD-X users (LHC: more than 400 around the world): need consistent database,
- ▶ if you have many machines: ideally use only one design program.

DESCRIBE AN ACCELERATOR IN MAD-X

Goals...

- ▶ **Describe, optimize and simulate** a machine with several thousand elements eventually with magnetic elements shared by different beams, like in colliders.

MAD-X LANGUAGE

How does MAD-X get this info? Via text (**interpreter**).

- ▶ It accepts and executes statements, expressions...
- ▶ it can be used interactively (**input from command line**) or in batch (**input from file**),
- ▶ many features of a programming language (loops, if's, ...).

All input statements are analysed by a parser and checked.

- ▶ E.g. **assignments**: properties of machine elements, set up of the lattice, definition of beam properties, errors...
- ▶ E.g. **actions**: compute lattice functions, optimize and correct the machine...

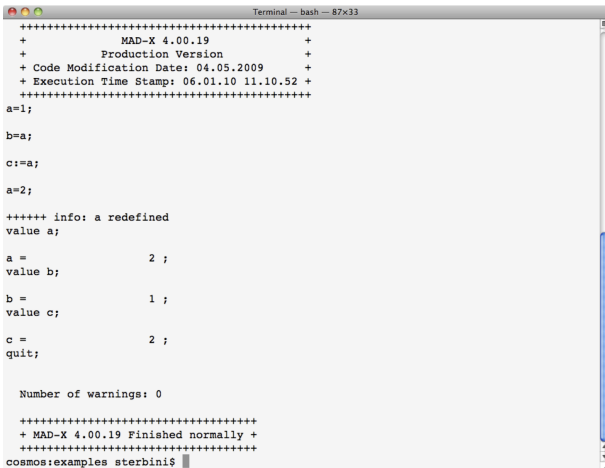

MAD-X INPUT LANGUAGE

- ▶ **Strong resemblance to "C" language** (but NO need for declarations and NOT case sensitive apart in expressions in inverted commas),
- ▶ free format, all statements are terminated with **;** (do not forget!),
- ▶ comment lines start with: **//** or **!** or is between **/*...*/**,
- ▶ Arithmetic expressions, including basic functions (**exp**, **log**, **sin**, **cosh**...), built-in random number generators and predefined constants (speed of the light, e , π , m_p , m_e ...).

In particular it is possible to use deferred assignments

- ▶ regular assignment: **a = b**, if **b** changes **a** does not,
- ▶ deferred assignment: **a := b**, if **b** changes **a** is updated too.

EXAMPLE: DEFERRED ASSIGNMENTS

```
Terminal -- bash -- 87x33
+++++
+          MAD-X 4.00.19          +
+      Production Version      +
+ Code Modification Date: 04.05.2009 +
+ Execution Time Stamp: 06.01.10 11.10.52 +

```

We use the **value** command to print the variables content.

DEFINITIONS OF THE LATTICE ELEMENTS

Generic pattern to define an element:

label: *keyword*, *properties*...;

- ▶ For a dipole magnet:
MBL: **SBEND**, **L=10.0**;
- ▶ For a quadrupole magnet:
MQ: **QUADRUPOLE**, **L=3.3**;
- ▶ For a sextupole magnet:
MSF: **SEXTUPOLE**, **L=1.0**;

In the previous examples we considered only the **L** property, that is the length in meters of the element.

THE STRENGTH OF THE ELEMENTS

The name of the parameter that define the **normalized magnetic strength** of the element depends on the element type.

- ▶ For dipole (horizontal bending) magnet is k_0 :

$$k_0 = \frac{1}{B\rho} B_y \text{ [in m}^{-1}\text{]}$$

- ▶ For quadrupole magnet is k_1 :

$$k_1 = \frac{1}{B\rho} \frac{\partial B_y}{\partial x} \text{ [in m}^{-2}\text{]}$$

- ▶ For sextupole magnet is k_2 :

$$k_2 = \frac{1}{B\rho} \frac{\partial^2 B_y}{\partial x^2} \text{ [in m}^{-3}\text{]}$$

INTERLUDE

What does k_1 mean? It is related to the quad focal length².

$$\frac{1}{k_1 L_{quad}} = f \quad (1)$$

Assuming $k_1 = 10^{-1} \text{ m}^{-2}$ and $L_{quad} = 10^{-1} \text{ m}$ the $f = 10^2 \text{ m}$.

²thin lens approximation

EXAMPLE: DEFINITIONS OF ELEMENTS

- ▶ Sextupole magnet:

`ksf = 0.00156;`

MSF: `SEXTUPOLE, K2 = ksf, L=1.0;`

- ▶ Multipole magnet "thin" element:

MMQ: `MULTIPOLE, KNL = {k0 · l, k1 · l, k2 · l, k3 · l, ... };`

- ▶ LHC dipole magnet as **thick** element:

`length = 14.3;`

`p = 7000;`

`angleLHC = 8.33 * clight * length/p;`

MBL: `SBEND, ANGLE = angleLHC;`

THE LATTICE SEQUENCE

A lattice sequence is an ordered collection of machine elements. Each element has a position in the sequence that can be defined wrt the CENTRE, EXIT or ENTRY of the element and wrt the sequence start or the position of an other element:

```
label: SEQUENCE, REFER=CENTRE, L=length;  
...;  
...;  
...here specify position of all elements...;  
...;  
...;  
ENDSEQUENCE;
```

EXAMPLE OF SEQUENCE: LHC (TOO TOUGH?)

```

Terminal - vim - 114x36

```

BEAM DEFINITION & SEQUENCE ACTIVATION

Generic pattern to define the beam:

label: **BEAM**, **PARTICLE**=x, **ENERGY**³=y,...;

e.g., **BEAM**, **PARTICLE**=proton, **ENERGY**=7000; // in GeV

After a sequence has been read, it can be activated:

USE, **SEQUENCE**=sequence_label;

e.g., **USE**, **SEQUENCE**=lhc1;

The **USE** command expands the specified sequence, inserts the drift spaces and makes it active.

³It is the TOTAL energy!

DEFINITION OF OPERATIONS

Once the sequence is activated we can perform operations on it.

- ▶ Calculation of Twiss parameters around the machine (**very important**) in order to know, for stable sequences, their main optical parameters.

TWISS, **SEQUENCE**=sequence_label; // periodic solution

TWISS, **SEQUENCE**=sequence_label, betx=1; // IC solution

- ▶ Production of graphical output of the main optical function (e.g., β -functions):

PLOT, **HAXIS**=s, **VAXIS**=betx,bety;

Example

TWISS, **SEQUENCE**=juaseq, **FILE**=twiss.out;

PLOT, **HAXIS**=s, **VAXIS**=betx, bety, **COLOUR**=100;

EXAMPLE OF THE TWISS FILE

```

* NAME          S          BETX          BETY

....
....

```

EXAMPLE OF THE GRAPHICAL OUTPUT (PS FORMAT)

MATCHING GLOBAL PARAMETERS

It is possible to modify the optical parameters of the machine using the MATCHING module of MAD-X.

- ▶ Adjust magnetic strengths to get desired properties (e.g., tune Q, chromaticity dQ),
- ▶ Define the **properties** to match and the **parameters** to vary.

Example:

```

MATCH, SEQUENCE=sequence_name;
  GLOBAL, Q1=26.58; // H-tune
  GLOBAL, Q2=26.62; // V-tune
  VARY, NAME= kqf, STEP=0.00001;
  VARY, NAME = kqd, STEP=0.00001;
  LMDIF, CALLS=50, TOLERANCE=1e-6; // method adopted
ENDMATCH;

```

OTHER TYPES OF MATCHING I

Local matching and performance matching:

- ▶ Local optical functions (insertions, local optics change),
- ▶ any user defined variable.

OTHER TYPES OF MATCHING II

Local matching and performance matching:

- ▶ Local optical functions (insertions, local optics change),
- ▶ any user defined variable.

Example:

```
MATCH, SEQUENCE=sequence_name;  
  CONSTRAINT, range=#e, BETX=50;  
  CONSTRAINT, range=#e, ALFX=-2;  
  VARY, NAME= kqf, STEP=0.00001;  
  VARY, NAME = kqd, STEP=0.00001;  
  JACOBIAN, CALLS=50, TOLERANCE=1e-6;  
ENDMATCH;
```

GENERAL CONSIDERATIONS ON MAD-X SYNTAX

Input language seems heavy, but:

- ▶ can be interfaced to data base and to other programs (e.g., Python, MatlabTM...),
- ▶ programs exist to generate the input interactively,
- ▶ allows web based applications,
- ▶ allows interface to operating system.

MAD-X can estimate the machine performance by:

- ▶ studying of long term stability with multipolar component,
- ▶ taking into account the tolerances for machine elements,
- ▶ simulating operation of the machine (imperfections,...).

DO WE USE MAD-X FOR EVERYTHING? **NO!**

MAD-X is an **optics** program (**single particle dynamics**).

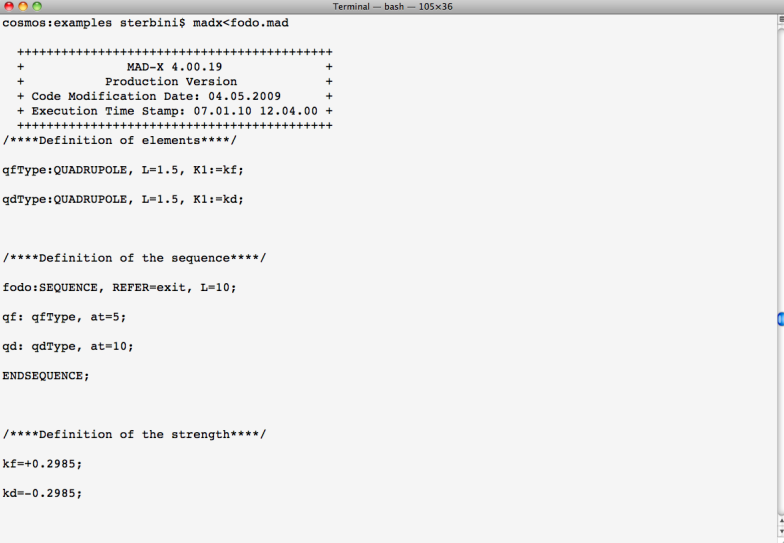

MAD-X has limitations where

- ▶ **multi particle and multi bunch** simulations are required,
- ▶ **machine is not static**, i.e., beam changes its own environment (space charge, instabilities, beam-beam effects...),
- ▶ requires self-consistent treatment, **computation of fields and forces**,
- ▶ execution **speed** is an issue,
- ▶ for detailed studies dedicated programs are needed, **but often with I/O interface to MAD-X**.
