The Longitudinal Spin Structure of the Proton: a Theory Overview

Friday 30 September 2016 11:05 (35 minutes)

I will review recent theoretical progress in our understanding of the longitudinal structure of the proton. My focus will be on the framework provided by perturbative quantum chromodynamics, and will include a discussion on the determination of helicity-dependent, collinear, parton distribution functions. Connections with nonperturbative models of nucleon structure will also be outlined. I will present some open issues in our present knowledge of the proton helicity structure, and comment on how these could be addressed in the future.

Presenter: NOCERA, Emanuele Roberto (University of Oxford)

Session Classification: Plenary

Track Classification: B. Helicity
