Baryon Spectroscopy with Polarized Photoproduction Observables from CLAS $^{\rm 1}$

Steffen Strauch, University of South Carolina for the CLAS Collaboration

Meson photoproduction is an important tool in the study of baryon resonances. The spectrum of broad and overlapping nucleon excitations can be greatly clarified by use of polarization observables. The N* program at Jefferson Lab with the CEBAF Large Acceptance Spectrometer (CLAS) includes experimental studies with linearly- and circularly-polarized tagged-photon beams, longitudinally- and transversely-polarized nucleon targets, and recoil polarizations. An overview of these experimental studies and recent results, particularly from single- and double-pion-production channels, will be presented.
