

# Fragmentation measurements in Belle

**22<sup>nd</sup> Spin symposium, UIUC/IU**  
**09/28/2016**

**Ralf Seidl (RIKEN)**

# What are fragmentation functions?

How do quasi-free partons fragment into confined hadrons ?

- Does spin play a role ? Flavor dependence?
- What about transverse momentum (and its Evolution) ?

What experiments measure :

- Normalized hadron momentum in CMS:  $e^+e^- \rightarrow h(z) X$  ;  $z = 2E_h / \sqrt{s}$
- Hadron pairs' azimuthal distributions:  $e^+e^- \rightarrow h_1 h_2 X$  ;  $\langle \cos(\phi_1 + \phi_2) \rangle$  ; Collins FF, Interference (IFF)
- Cross sections or multiplicities differential in  $z$ :  $ep \rightarrow hX$ ,  $pp \rightarrow hX$

Additional benefits of the FF measurements :

- Pol FFs necessary input to transverse spin SIDIS and pp measurements to extract Transversity distributions function
- Flavor separation of all Parton distribution functions (PDFs) via FFs (including unpolarized PDFs)
- Baseline for **any** Heavy Ion measurement
- Access to exotics?

# Unpolarized fragmentation functions

$$D_{1,q}^h(z, Q^2)$$

# Unpolarized light hadron fragmentation

In  $e^+e^-$  annihilation:

$$Q = \sqrt{s}$$

$$z = \frac{2E_h}{Q} \approx \frac{E_h}{E_q}$$

Phys.Rev.Lett. 111 (2013) 062002,  
Leitgab, RS, et al (Belle)

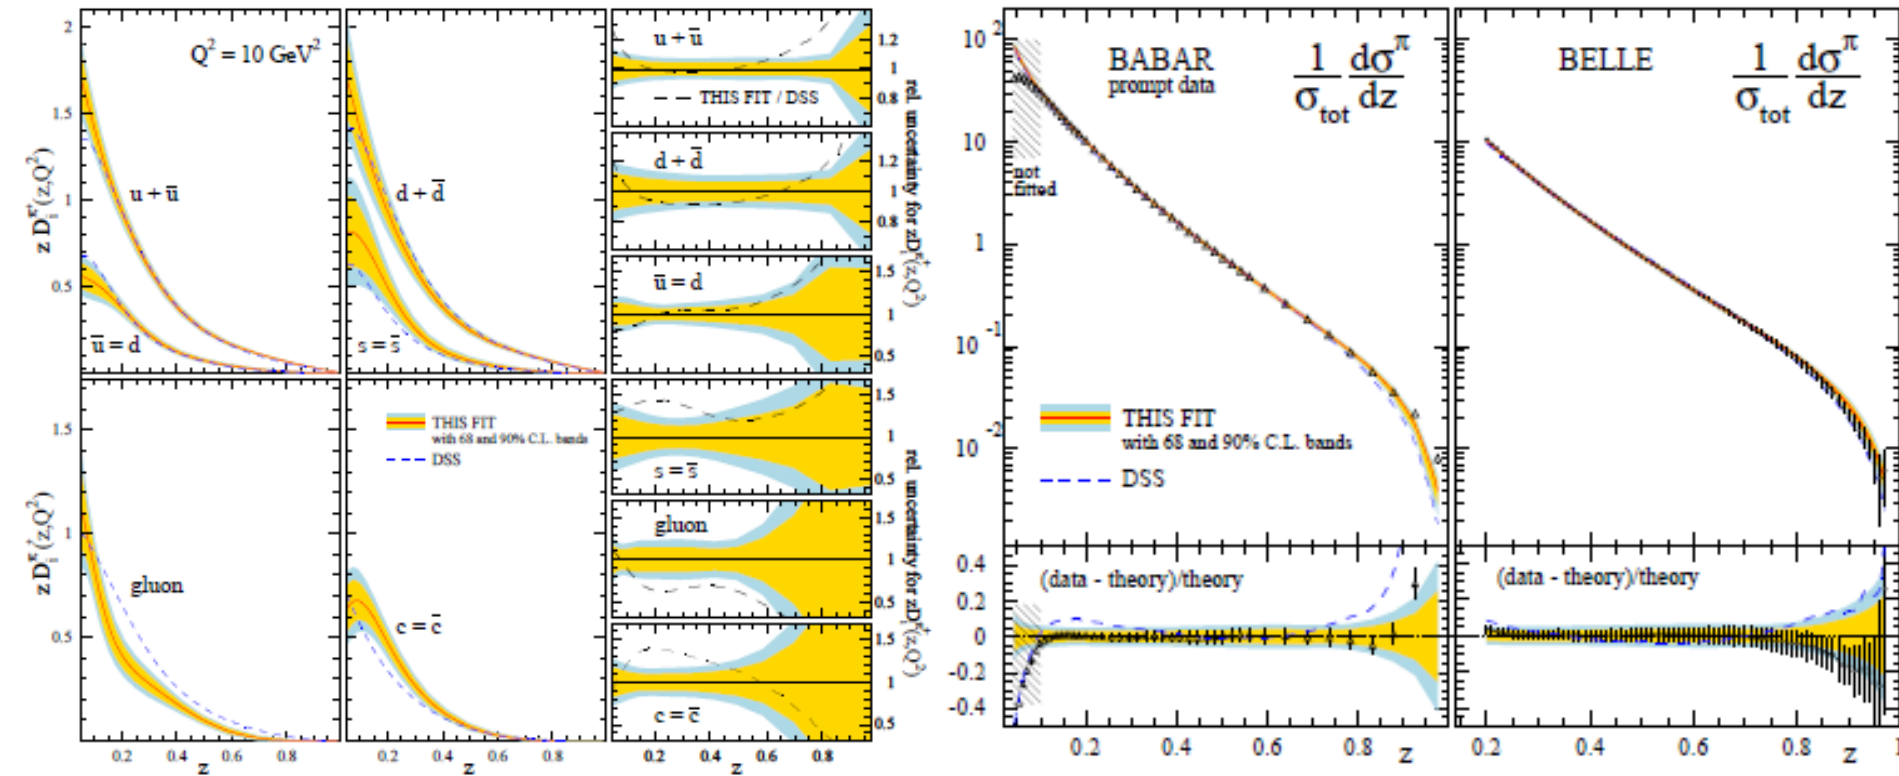

- Single-hadron cross sections at leading order in  $\alpha_s$  related to fragmentation functions

$$\sigma(e^+e^- \rightarrow hX) \propto \sum_q e_q^2 (D_{1,q}^h(z) + D_{1,\bar{q}}^h(z))$$

- Only at higher orders access to gluon FFs

# Belle data using in global FF fits

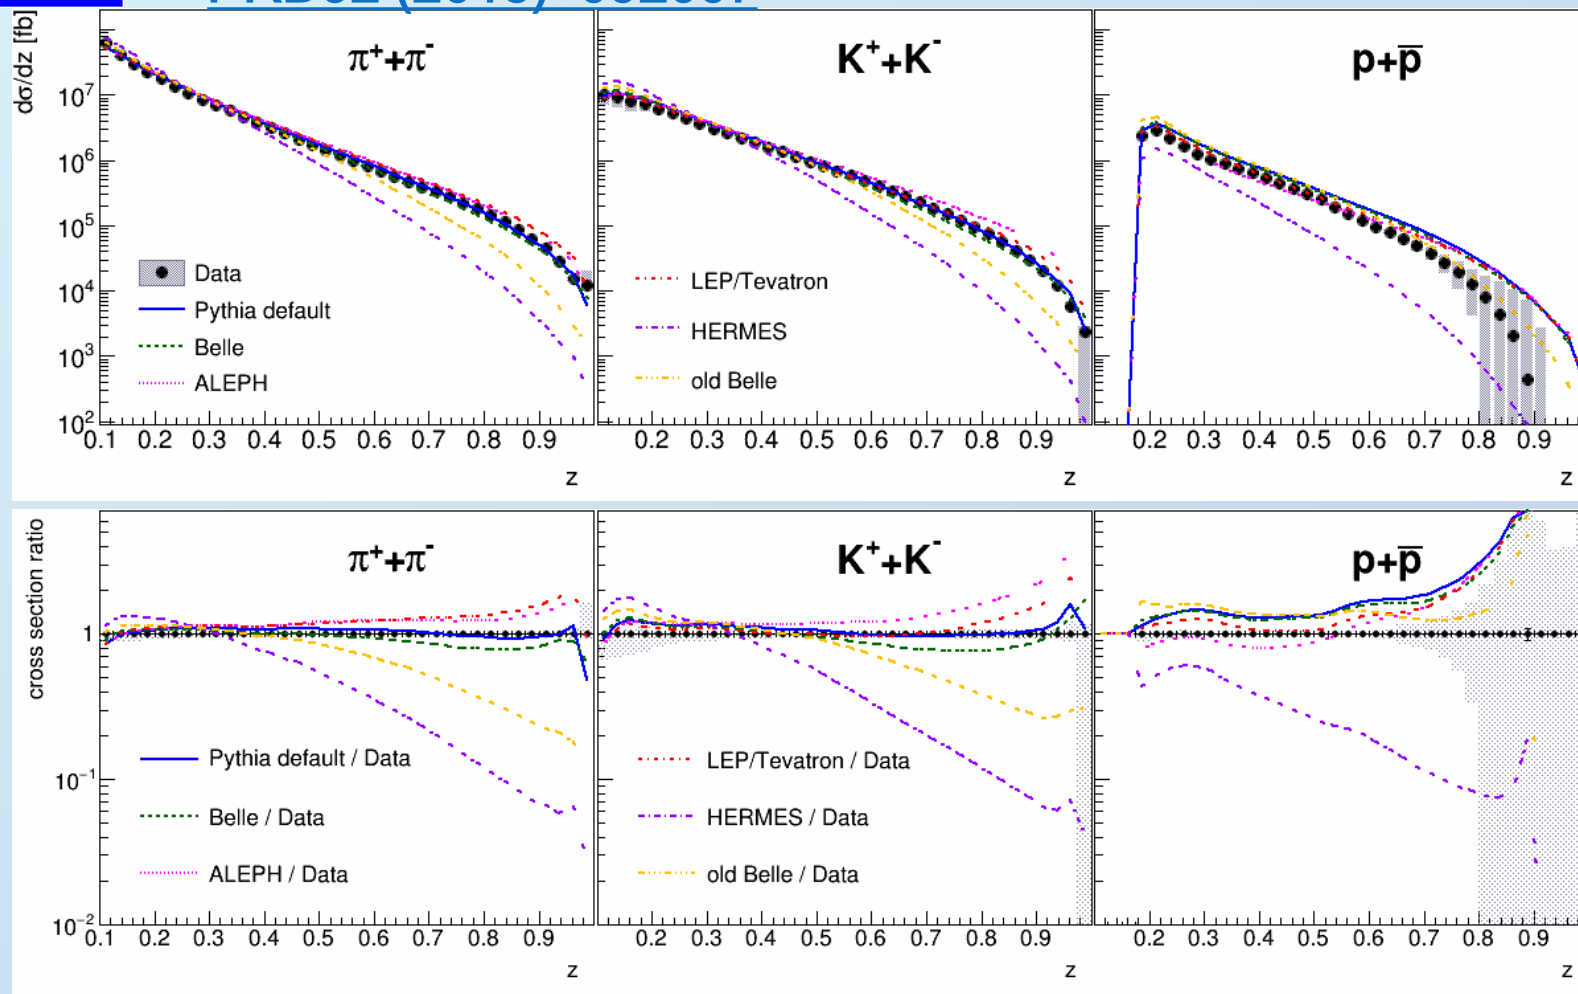

Phys.Rev. D91 (2015) 1, 014035

- Together with other new data substantial improvement in uncertainties
- Shift in central values
- Good description of B-factory data
- Also recent inclusion in JAMFF fit [arXiv1609.00899](https://arxiv.org/abs/1609.00899)

# New addition: single protons

PRD92 (2015) 092007

- Default Pythia and current Belle in good agreement with pions and kaons
- Protons not well described by any tune

# Transverse momentum dependence

Aka un-integrated PDFs and FFs

$$D_{1,q}^{h}(z, Q^2, k_t)$$

# $K_T$ Dependence of FFs

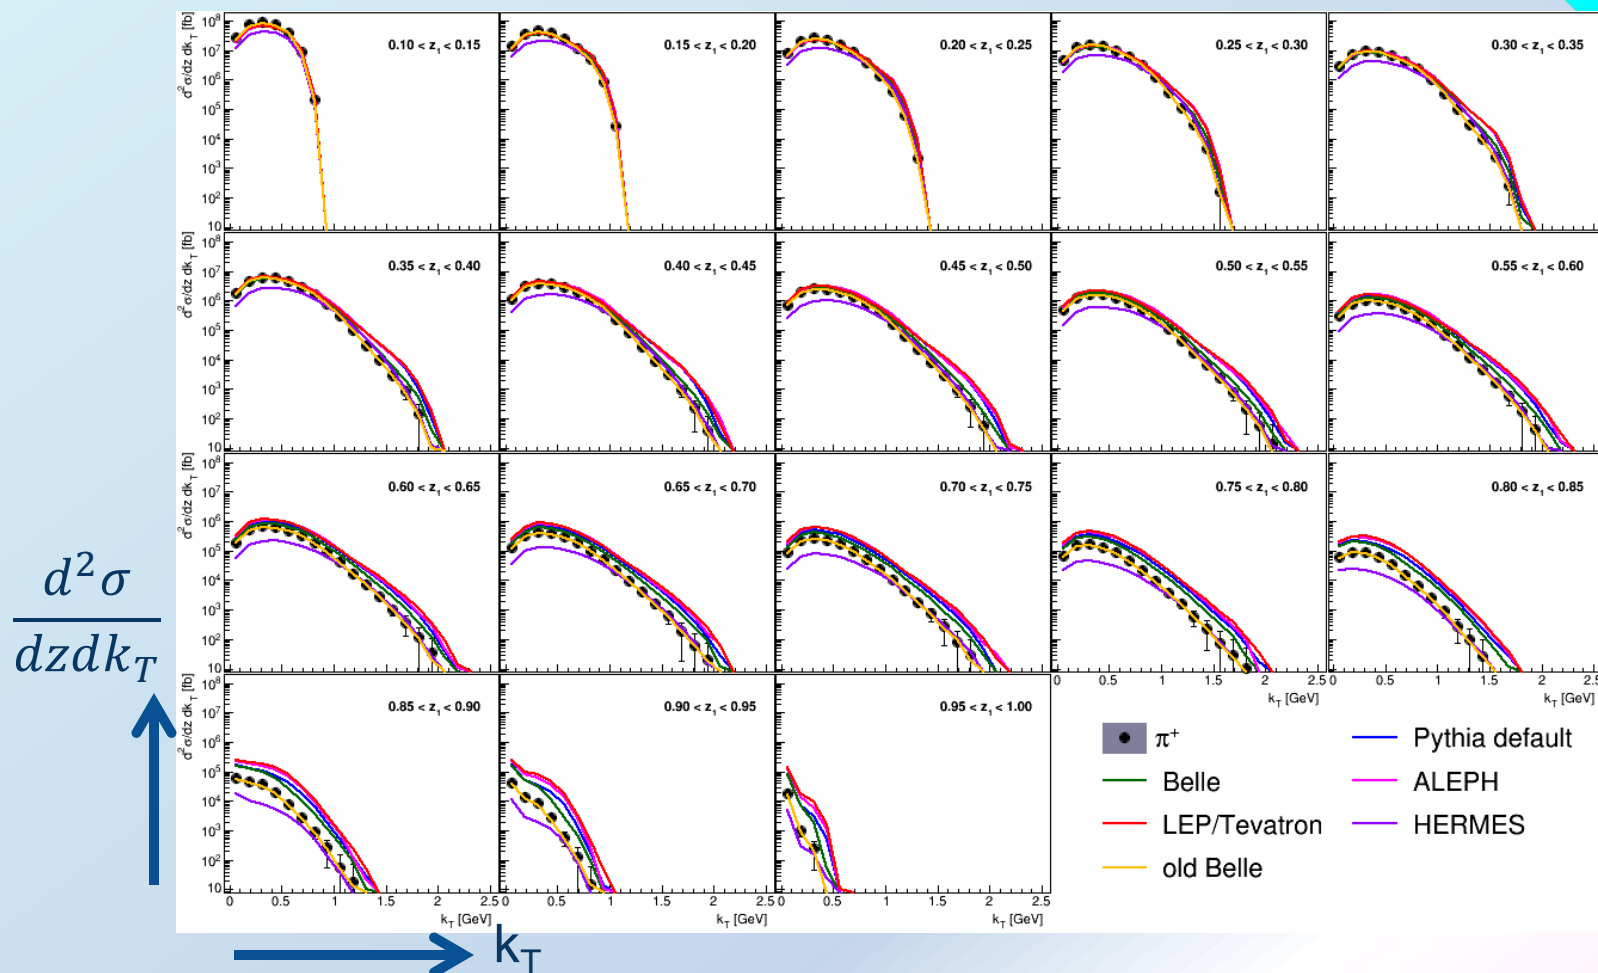

- Gain also sensitivity into transverse momentum generated in fragmentation
- Two ways to obtain transverse momentum dependence
  - Traditional **2-hadron** FF
    - use transverse momentum between two hadrons (in opposite hemispheres)
    - Usual convolution of two transverse momenta
  - Single-hadron FF wrt to **Thrust** or jet axis
    - No convolution
    - Need correction for  $q\bar{q}$  axis

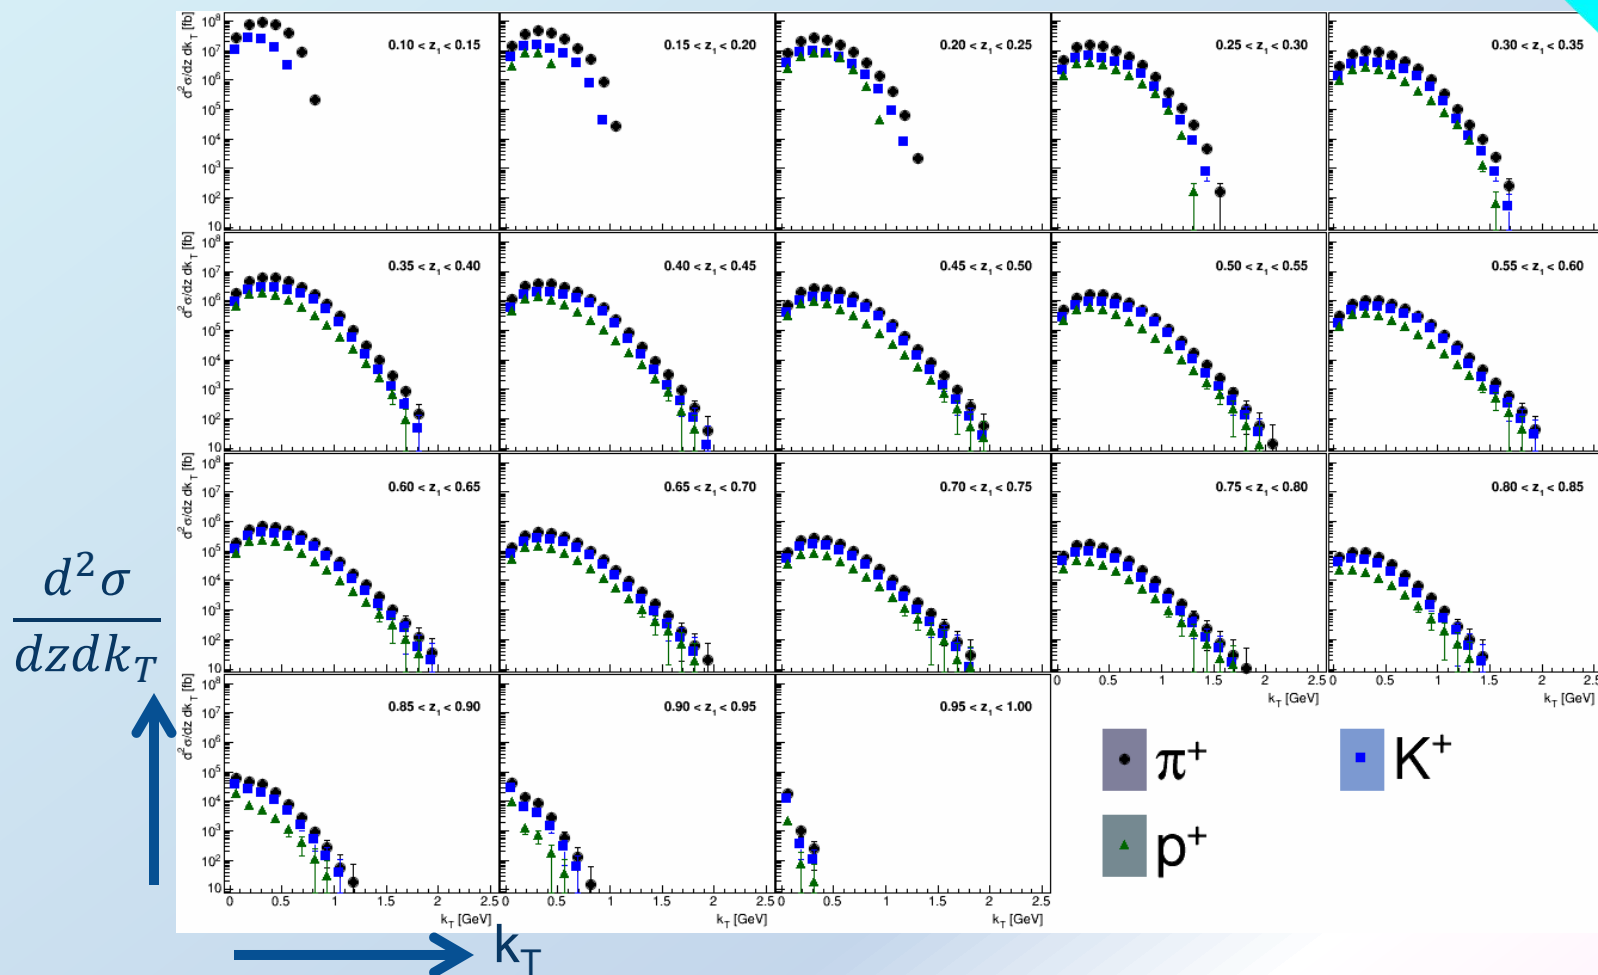

# MC example of $k_T$ sensitivities using thrust method

## MC simulation

# MC sample for various hadrons

## MC simulation

# MC examples vs $k_T^2$

Fit exponential to smaller transverse momenta for  
Gaussian  $k_T$  dependence and power law at higher  $k_T$

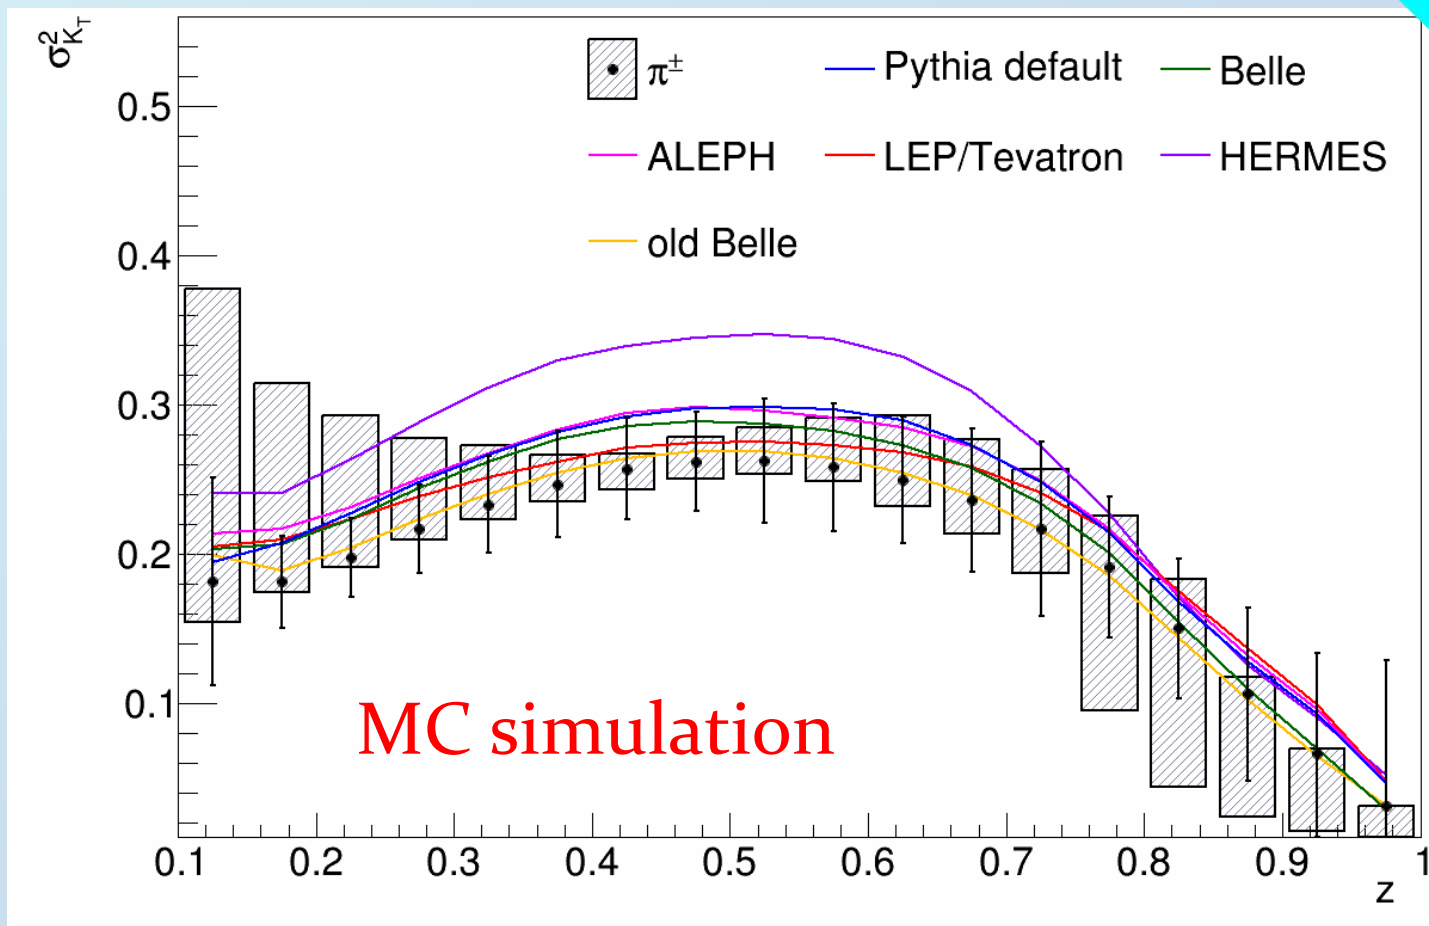

# MC Gaussian widths

Once available for data this will be the first direct (no convolutions) measurement of  $z$  dependence of Gaussian widths

# MC Gaussian widths

The widths can be used to improve the Pythia fragmentation settings

$$Q = \sqrt{s}$$

$$z = \frac{2E_h}{Q} \approx \frac{E_h}{E_q}$$

- Single inclusive hadron multiplicities ( $e^+e^- \rightarrow hX$ ) sum over all available flavors and quarks and antiquarks:

$$d\sigma(e^+e^- \rightarrow hX)/dz \propto \sum_q e_q^2 (D_{1,q}^h(z, Q^2) + D_{1,\bar{q}}^h(z, Q^2))$$

- Especially distinction between favored (ie  $u \rightarrow \pi^+$ ) and disfavored ( $\bar{u} \rightarrow \pi^+$ ) fragmentation would be important
- Idea: Use di-hadron fragmentation, preferably from opposite hemispheres and access favored and disfavored combinations:

$$u\bar{u} \rightarrow \pi^+ \pi^- X \propto D_{u,fav}^{\pi^+}(z_1, Q^2) \cdot D_{\bar{u},fav}^{\pi^-}(z_2, Q^2) + D_{\bar{u},dis}^{\pi^+}(z_1, Q^2) \cdot D_{u,dis}^{\pi^-}(z_2, Q^2)$$

$$u\bar{u} \rightarrow \pi^+ \pi^+ X \propto D_{u,fav}^{\pi^+}(z_1, Q^2) \cdot D_{\bar{u},dis}^{\pi^+}(z_2, Q^2) + D_{\bar{u},dis}^{\pi^+}(z_1, Q^2) \cdot D_{u,fav}^{\pi^+}(z_2, Q^2)$$

- Also: unpol baseline for interference fragmentation

# Setup

- Generally look at 4 x 4 hadron combinations (  $\pi$ , K, +, - )
  - Keep separate until end: only 6 independent yields
- 3 hemisphere combinations:
  - same hemisphere (thrust > 0.8)
  - opposite hemisphere ( thrust > 0.8 )
  - any combination ( no thrust selection)
- 16 x 16  $z_1 z_2$  binning between 0.2 - 1

# Correction chain

Correction	Method	Systematics
PID mis-id	PID matrices (5x5 for $\cos \theta_{\text{lab}}$ and $p_{\text{lab}}$ )	MC sampling of inverted matrix element uncertainties
Momentum smearing	MC based smearing matrices (256x256), SVD unfold	SVD unfolding vs analytically inverted matrix, reorganized binning, MC statistics
Non-qqbar BG removal	eeuu, eess, eecc, tau MC subtraction	Variation of size, MC statistics
Acceptance I (cut efficiency)	In barrel reconstructed vs udsc generated in barrel	MC statistics
Acceptance II	udsc Gen MC barrel to $4\pi$	MC statistics
Weak decay removal (optional)	udcs check evt record for weak decays	Compare to other Pythia settings
Acceptance III	Extrapolation to $ \cos\theta  \rightarrow 1$ in (Fit to MC)	Fit uncertainties
ISR	Keep event fraction with $E > 0.995 E_{\text{cms}}$	

# Full results for pion pairs

[PRD92 \(2015\) 092007](#)

Pion pair example in any topology combination shown here

# Ratios to opposite charge pion pairs

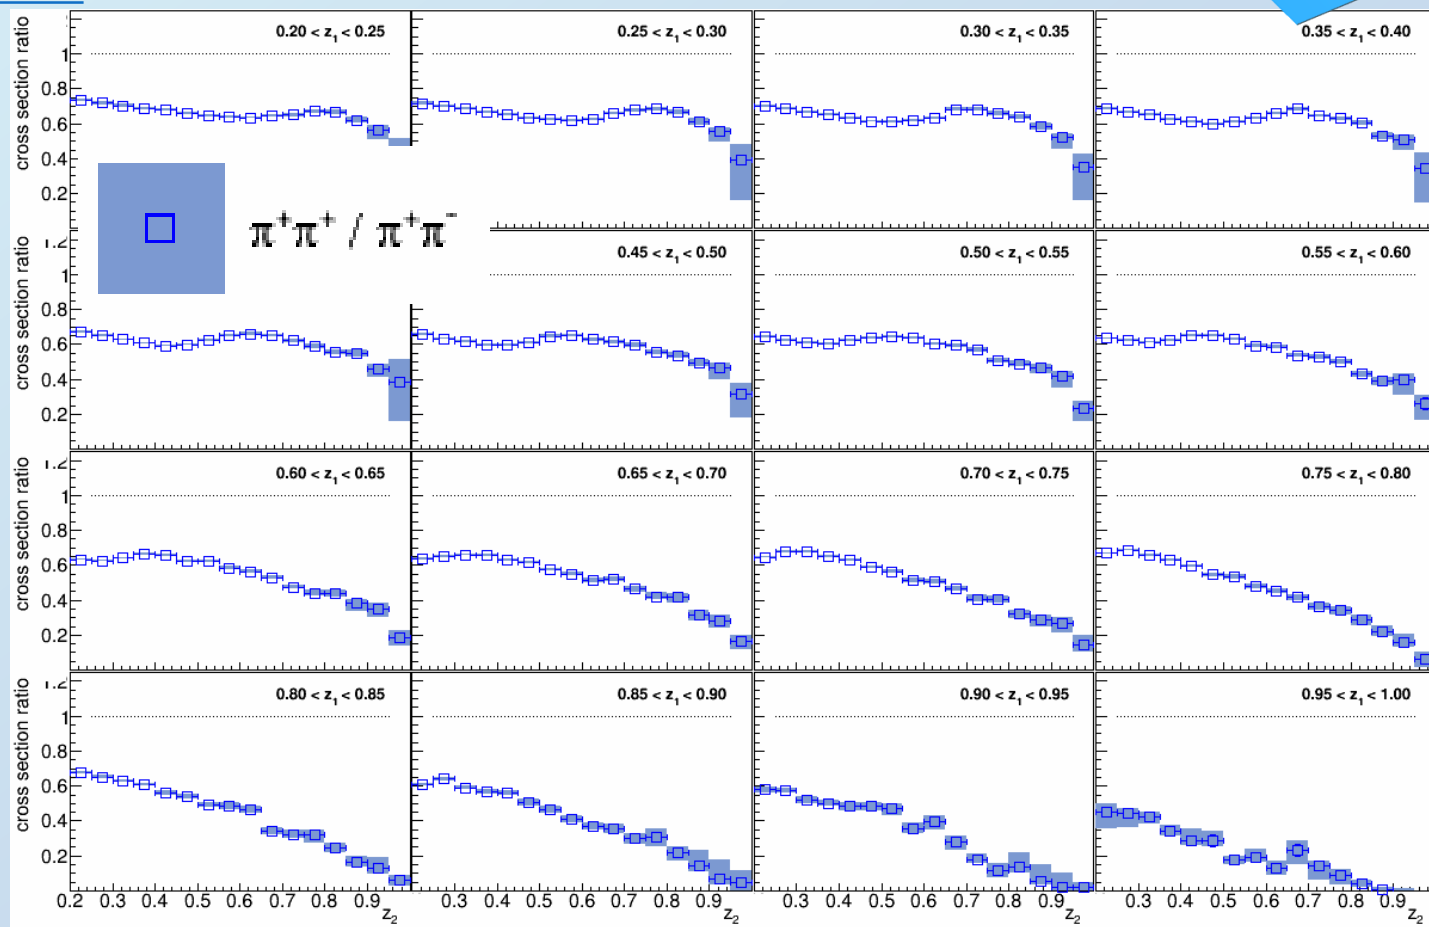

$$R \approx \frac{D_{fav}(z_1)D_{fav}(z_2) + D_{dis}(z_1)D_{dis}(z_2)}{D_{dis}(z_1)D_{fav}(z_2) + D_{fav}(z_1)D_{dis}(z_2)}$$

PRD92 (2015) 092007

$\pi^+\pi^+$  comparable to  $\pi^+\pi^-$  at low  $z$ , decreasing towards high  $z$ :

- Favored and disfavored fragmentation similar at low  $z$
- Disfavored much smaller at high  $z$

# Results for diagonal $z_1 z_2$ bins

[PRD92 \(2015\) 092007](#)

Diagonal  $z_1, z_2$  bins

Low  $z$  dominates  
integral:

→ Well defined,  
all tunes agree

High  $z$  not well  
measured,  
especially at  
Belle energies:  
→ large spread in  
tunes

Default Pythia  
settings and  
current Belle  
setting with good  
agreement

# Hemisphere composition

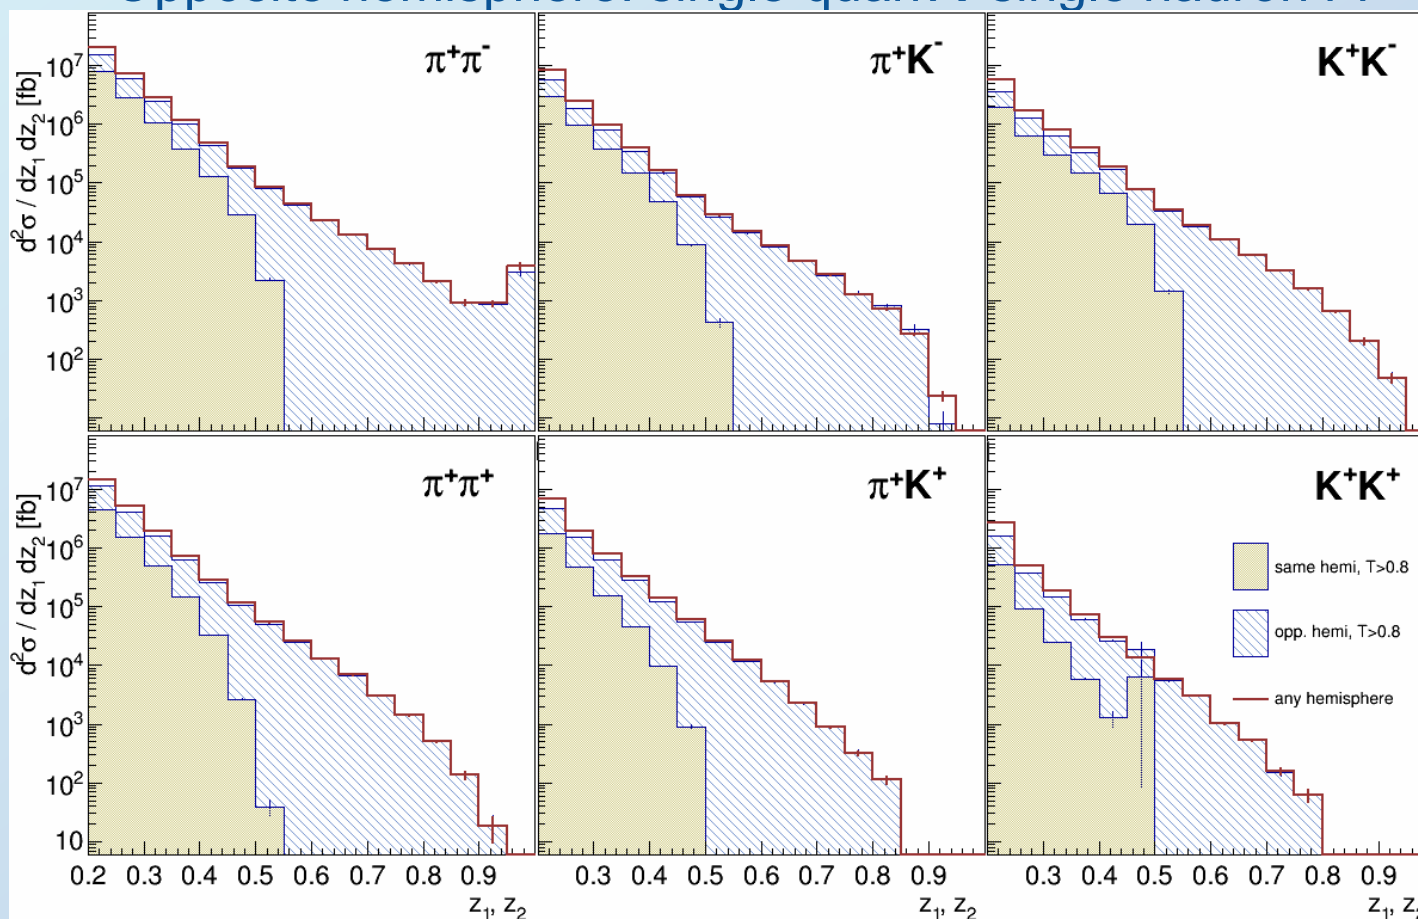

Same hemisphere contribution drops rapidly

Consistent with LO assumption of

Same hemisphere: single quark  $\rightarrow$  di-hadron FF:  $(z_1+z_2 < 1)$

Opposite hemisphere: single quark  $\rightarrow$  single hadron FF

Diagonal  
 $z_1, z_2$   
bins

Systematic uncertainties not displayed

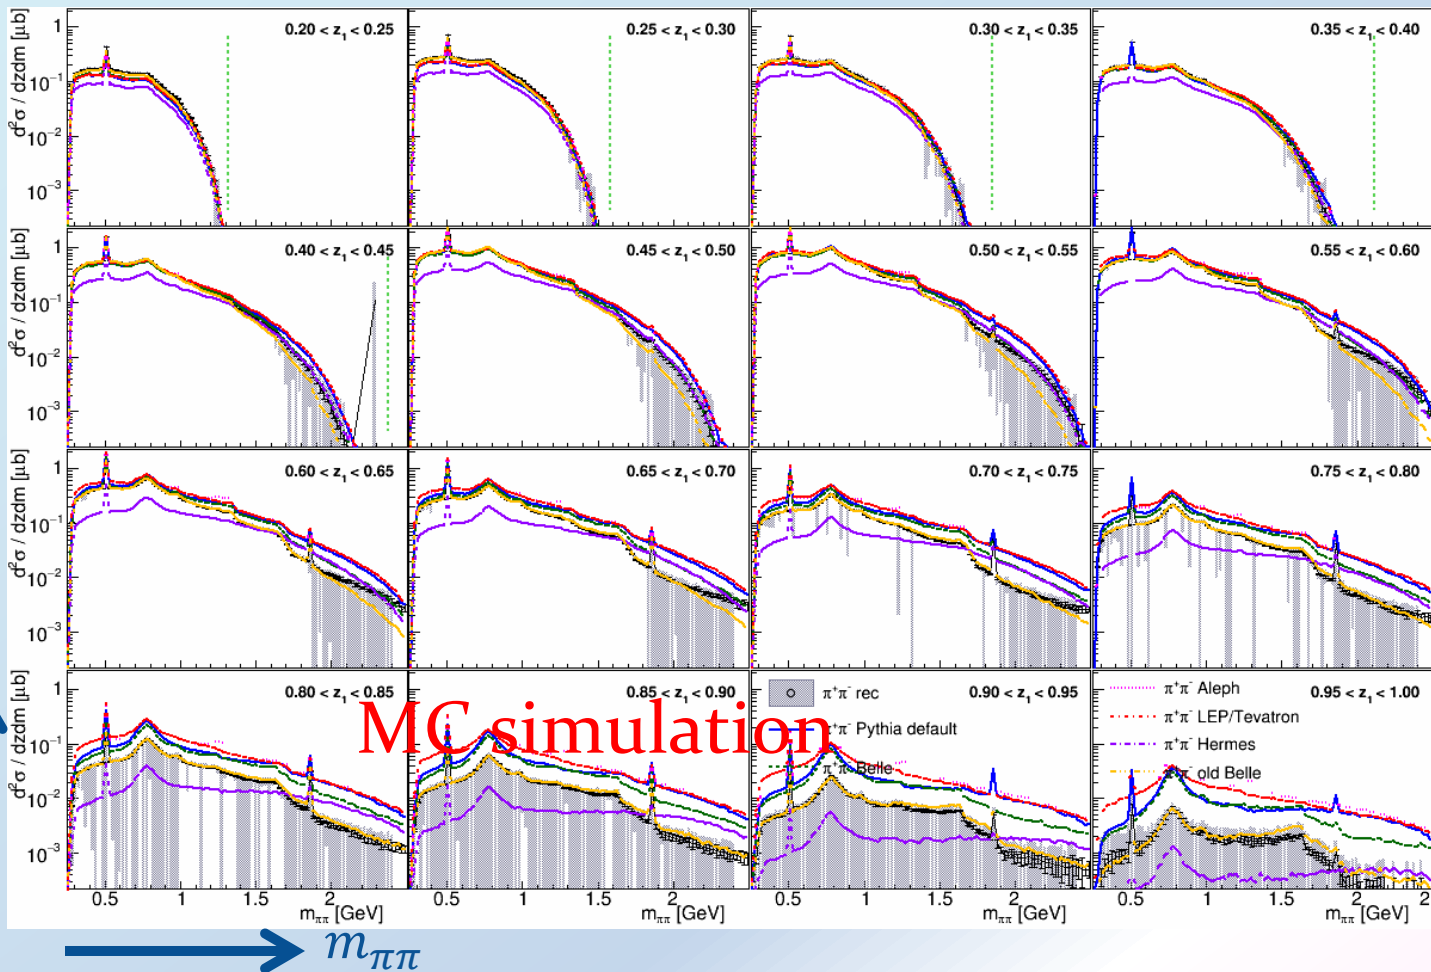

# Di-hadron mass dependence

Similar analysis in same hemisphere and mass – combined  $z$  binning. Important input for IFF based transversity global analysis

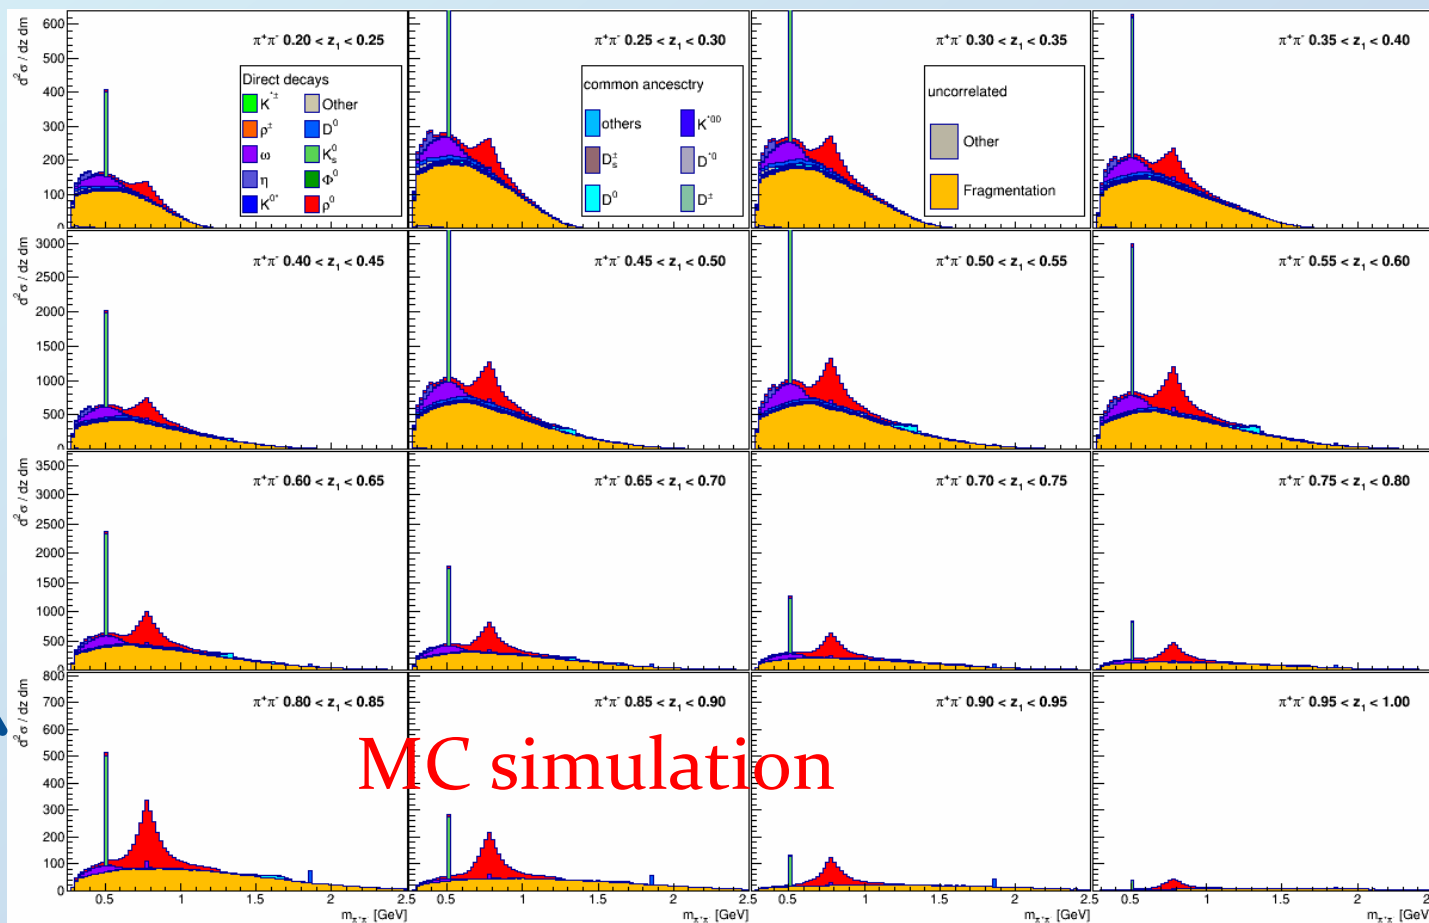

# Mass dependence comparisons to Pythia tunes

# Di-pion individual contributions

Contributions from various resonances and direct fragmentation

$$\frac{d^2\sigma}{dz dm_{\pi\pi}}$$

$$m_{\pi\pi}$$

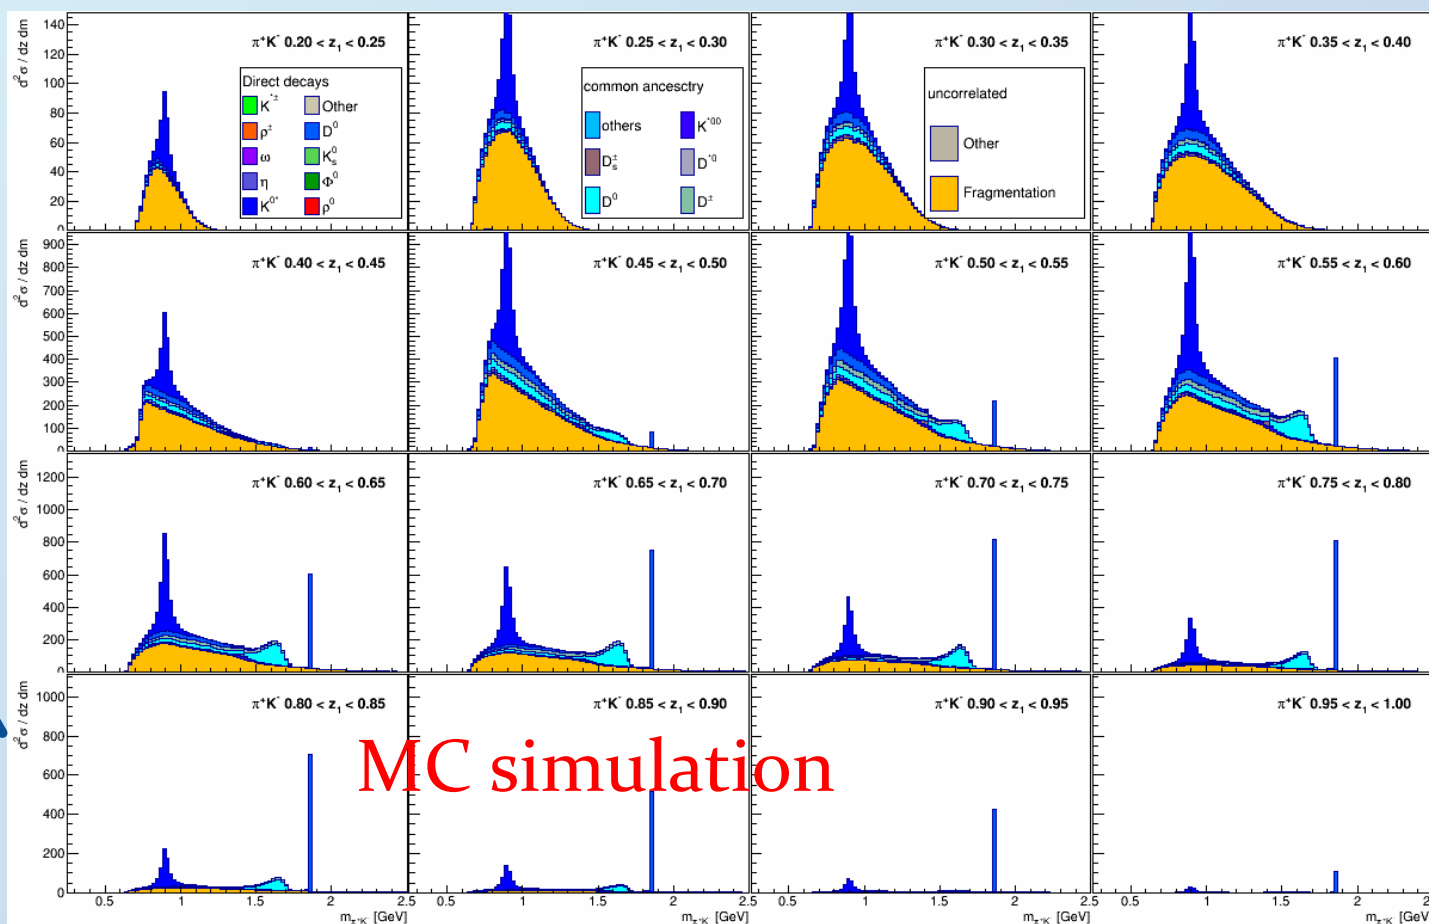

# Di-hadron mass dependence

Pion – kaon pairs

# Pion-kaon individual contributions

MC simulation

$$\frac{d^2 \sigma}{dz dm_{\pi K}}$$

$m_{\pi K}$

# Hyperon and charmed baryons

$\Lambda\{uds\}$   
 $\Lambda(1520)[3/2^-]$   
 $\Sigma\{dds, uds, uud\}$   
 $\Sigma(1385)[3/2^+]$   
 $\Xi\{dss, uss\}$   
 $\Omega\{sss\}[3/2^+]$

- Main focus of analysis on total production cross sections, but final publication will contain  $x_p$  dependence
- Production rates can be explained by separate lines for hyperons and charmed baryons and according to strangeness
- Large discrepancy to ARGUS likely due to proper feed-down treatment in Belle analysis

# Strange baryon & Charmed baryon production rates II

Taken from Hadron13 talk by Sumihama

Strange baryons

$\Lambda, \Sigma(ud\textcolor{red}{s})$   
 $[qq](S=0 \text{ or } 1) + [s]$

$m_u, m_d \approx m_s \Rightarrow [qq\textcolor{red}{s}], \text{ uniform}$

Charmed baryons

$\Lambda_c, \Sigma_c(ud\textcolor{red}{c})$   
 $[qq](S=0 \text{ or } 1) + [c]$

$m_u, m_d \ll m_c \Rightarrow \begin{matrix} \text{diquark} + \text{Quark} \\ [qq] \quad [c] \end{matrix}$

Good diquark $[ud] + c >$  Bad diquark $[ud] + c$   
 good di-quark  $>$  bad di-quark  
 due to strong attractive force of good diquark

# Single $\Lambda$ polarization measurements

→ YingHui Guan,  
Tuesday TMD session

- Fragmentation counterpart to the Sivers Function:  
unpolarized parton fragments into transversely polarized baryon with transverse momentum wrt to parton direction
- Reconstruct  $\Lambda$ , its transverse momentum and polarization

# Continuation of spin-dependent FF analysis

- Finalization of Kaon related Collins analysis and its  $k_t$  dependence ongoing
- Finalization of di-hadron handedness studies ([arXiv:1505.08020](https://arxiv.org/abs/1505.08020)) ongoing
- New neutral pion and eta Collins asymmetries close to being released

# Summary and outlook

- Unpolarized single-hadron cross sections extracted and already used in global FF fits
- First di-hadron + single proton cross sections from  $e^+e^-$  extracted
  - Access to disfavored fragmentation via ordering of pion and kaon pairs
- Di-hadron mass dependent cross sections forthcoming
- First  $\Lambda$  polarization results
- Transverse momentum dependent FF analysis ongoing
- Finalization of kaon,  $\pi^0$  and  $\eta$  related Collins results

# Single hadrons

Previously un-published Proton cross sections extracted

# Differences in Pythia/JetSet settings

PARJ(82)	:	invariant mass cut-off for parton showers

# ISR correction

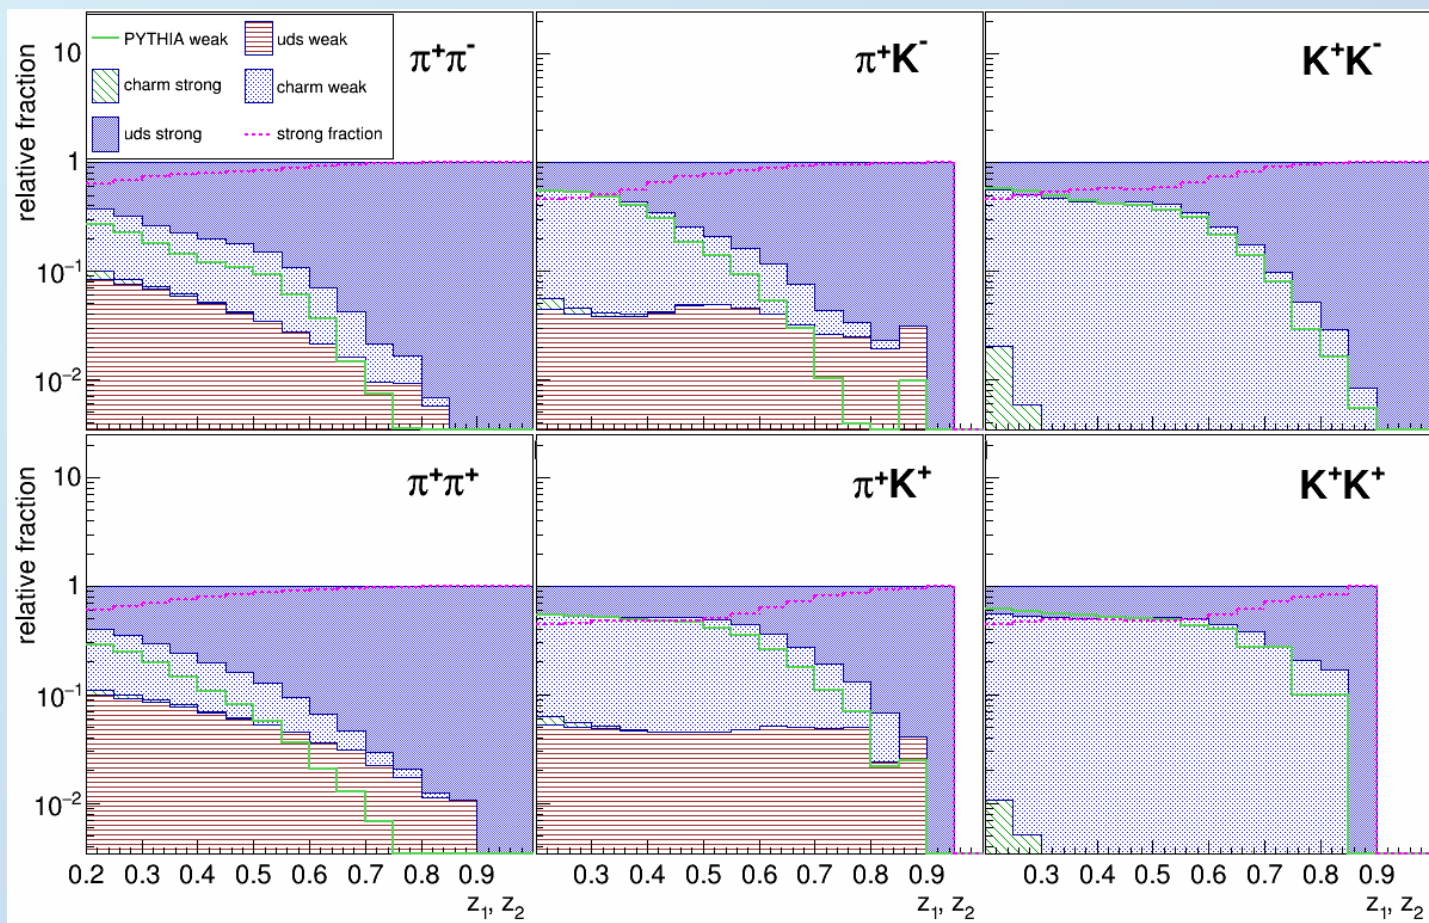

Fraction of events with CM energy reduced by less than 0.5% larger than 70% and rising with  $z$  based on MC

# Weak vs strong decays

uds production → mostly strong decays into pions and kaons  
 Charm production → mostly weak decays

# Non q-qbar removal

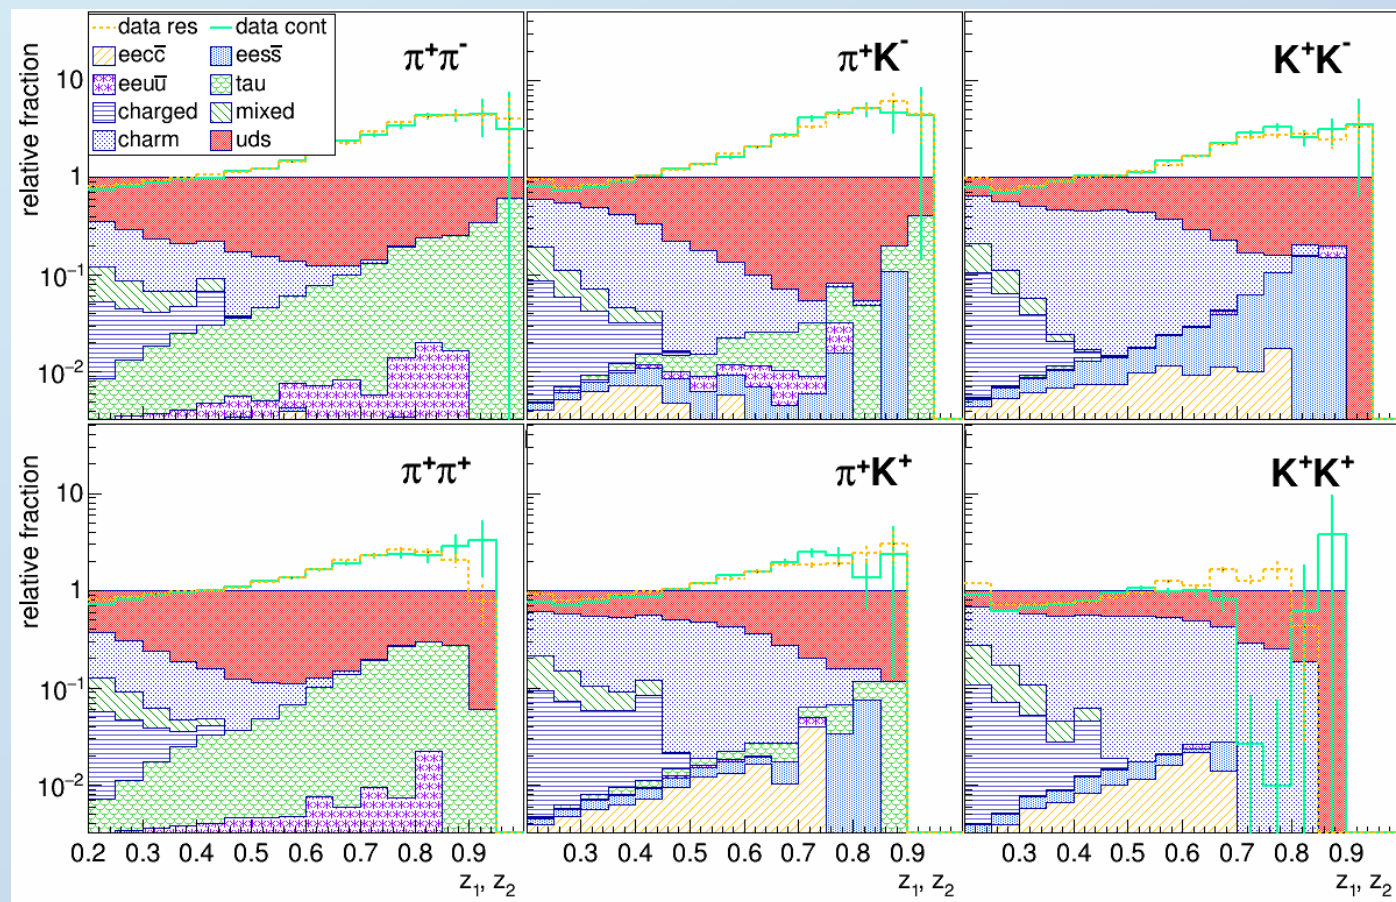

Diagonal  $z_1, z_2$  bins

Remove all non q-qbar (u,d,s,c pair) events:

Most dominant contributions are:

- remaining  $\tau$  pairs,
- $Y$  decays
- 2 photon to quark processes

# Total corrections to raw yields

Diagonal  $z_1, z_2$  bins

Biggest differences at large  $z$  due to smearing and reconstruction

# Systematics budget

Diagonal  $z_1, z_2$  bins

# Cuts

- $|Z|$  vertex  $< 4\text{cm}$  , r vertex  $< 2\text{cm}$ ,  $P_t > 100\text{MeV}$ ,
- Eid, muid, then hadron id:
  - $k_{pi}(3,1,0,3,2)$ ;  $k_{pr}(3,1,0,3,4)$ ;  $p_{ipr}(3,1,0,2,4)$ ;
  - Always two hadron ids cut on, should be similar to Martin's analysis
- Hadronb  $> 0.5$
- NSVD hits  $\geq 3$
- Evisible  $> 7\text{ GeV}$
- $z_1, z_2 > 0.1$  (or 0.2)
- $\cos\theta_{lab} > -0.511$  &&  $\cos\theta_{lab} < 0.842$  (matching Martin's PID studies and full PID acceptance)
- If thrust cut (same/opposite hemispheres) : thrust  $> 0.8$  and  $|\text{thrust}_z| < 0.75$
- Opening angle between thrust axis and track  $> 0.8$

# Analysis strategy

- First: look only at  $z_1$   $z_2$  dependence (16x 16 bins from 0.2 to 1.0)
- Later (after preliminary and publication?): mass dependence in same hemisphere, decaying hadron FFs ( $\rho, K^*, \phi$ , etc)
- Follow closely Martin Leitgab's analysis :
  - Particle id (unfolded, need to evaluate uncertainties)
  - Smearing
  - Non qqbar (tau ok, Upsilon ok, 2photon)
  - Acceptance, decay in-flight, Hadron B, E visible (today)
  - Weak decay fraction (essentially all charm)
  - ISR

# Transverse momentum dependence

Aka un-integrated PDFs and FFs

$$D_{1,q}^{h}(z, Q^2, k_t)$$

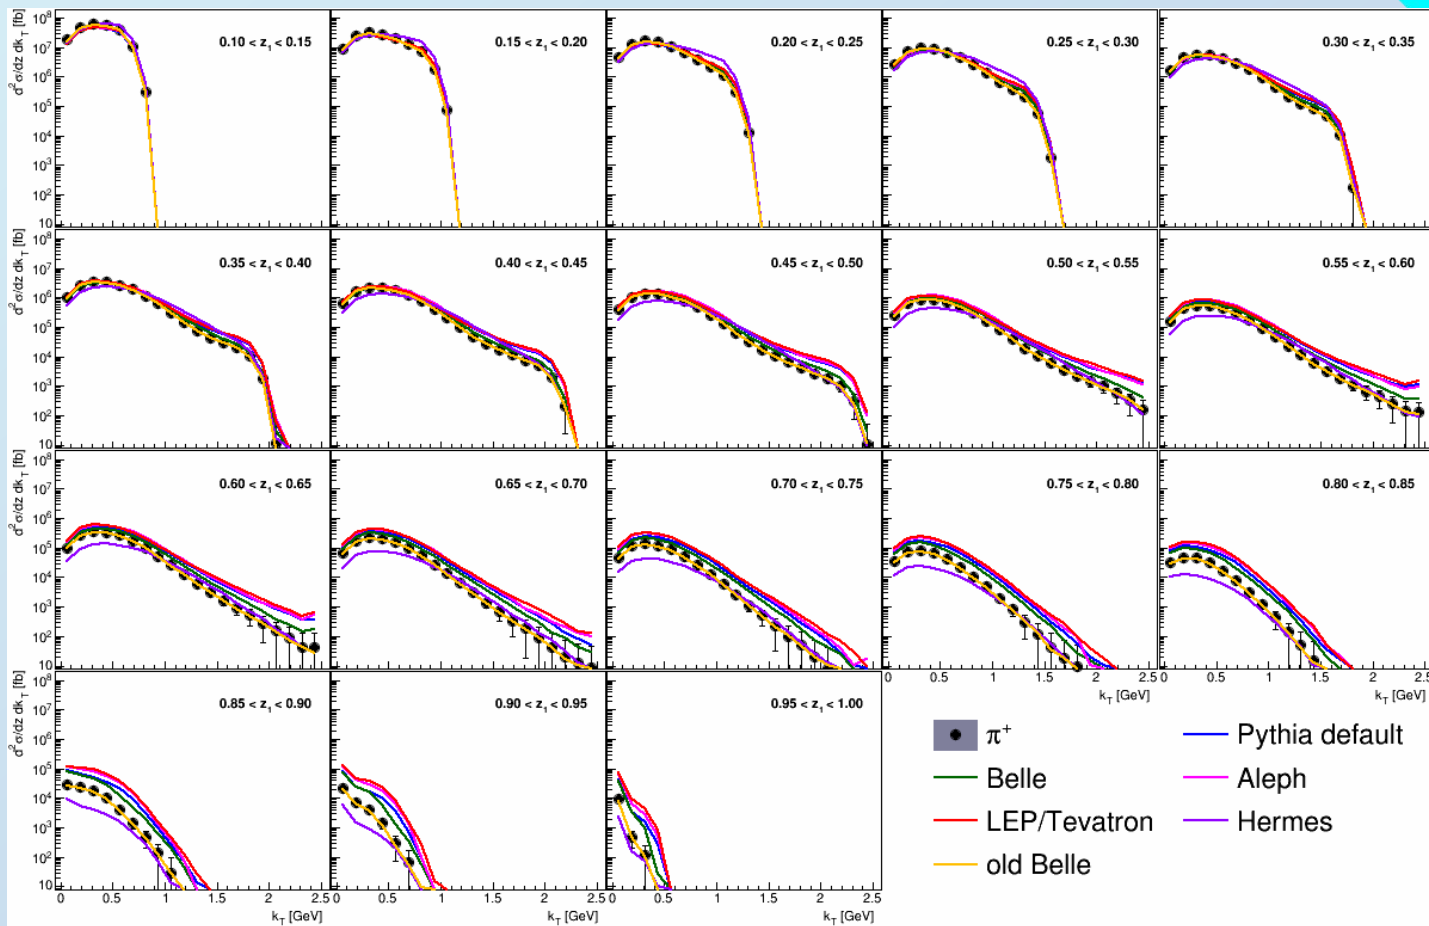

# $K_T$ Dependence of FFs

- Gain also sensitivity into transverse momentum generated in fragmentation
- Two ways to obtain transverse momentum dependence
  - Traditional **2-hadron** FF
    - use transverse momentum between two hadrons (in opposite hemispheres)
    - Usual convolution of two transverse momenta
  - Single-hadron FF wrt to **Thrust** or jet axis
    - No convolution
    - Need correction for  $q\bar{q}$  axis

# MC example of $k_T$ sensitivities

# Spin dependent fragmentation

$$H_{1,q}^{h,\perp}(z, Q^2, k_t)$$

$$H_{1,q}^{h_1, h_2, \triangleleft}(z, Q^2, M_h)$$

# Collins fragmentation function

J. Collins, Nucl. Phys. B396, (1993) 161

$$D_{q\uparrow}^h(z, P_{h\perp}) = D_{1,q}^h(z, P_{h\perp}^2) + H_{1,q}^{\perp h}(z, P_{h\perp}^2) \frac{(\hat{\mathbf{k}} \times \mathbf{P}_{h\perp}) \cdot \mathbf{S}_q}{zM_h}$$

- Spin of quark correlates with hadron transverse momentum
- translates into azimuthal anisotropy of final state hadrons

# Collins fragmentation in $e^+e^-$ : Angles and Cross section $\cos(\phi_1 + \phi_2)$ method

$e^+e^-$  CMS frame:

D.Boer: Nucl.Phys. B806 (2009) 23-6

2-hadron inclusive transverse momentum dependent cross section:

$$\frac{d\sigma(e^+e^- \rightarrow h_1 h_2 X)}{d\Omega dz_1 dz_2 d^2 q_T} = \dots B(y) \cos(\phi_1 + \phi_2) H_1^{\perp[1]}(z_1) \bar{H}_1^{\perp[1]}(z_2)$$

$$B(y) = y(1-y) \stackrel{\text{cm}}{=} \frac{1}{4} \sin^2 \Theta$$

Net (anti-)alignment of  
transverse quark spins

- **Red points** :  $\cos(\phi_1 + \phi_2)$  moment of **Unlike** sign pion pairs over **like** sign pion pair ratio :  $A^{\text{UL}}$
- **Green points** :  $\cos(\phi_1 + \phi_2)$  moment of **Unlike** sign pion pairs over **any charged** pion pair ratio :  $A^{\text{UC}}$
- Collins fragmentation is large effect
- Consistent with SIDIS indication of sign change between favored and disfavored Collins FF

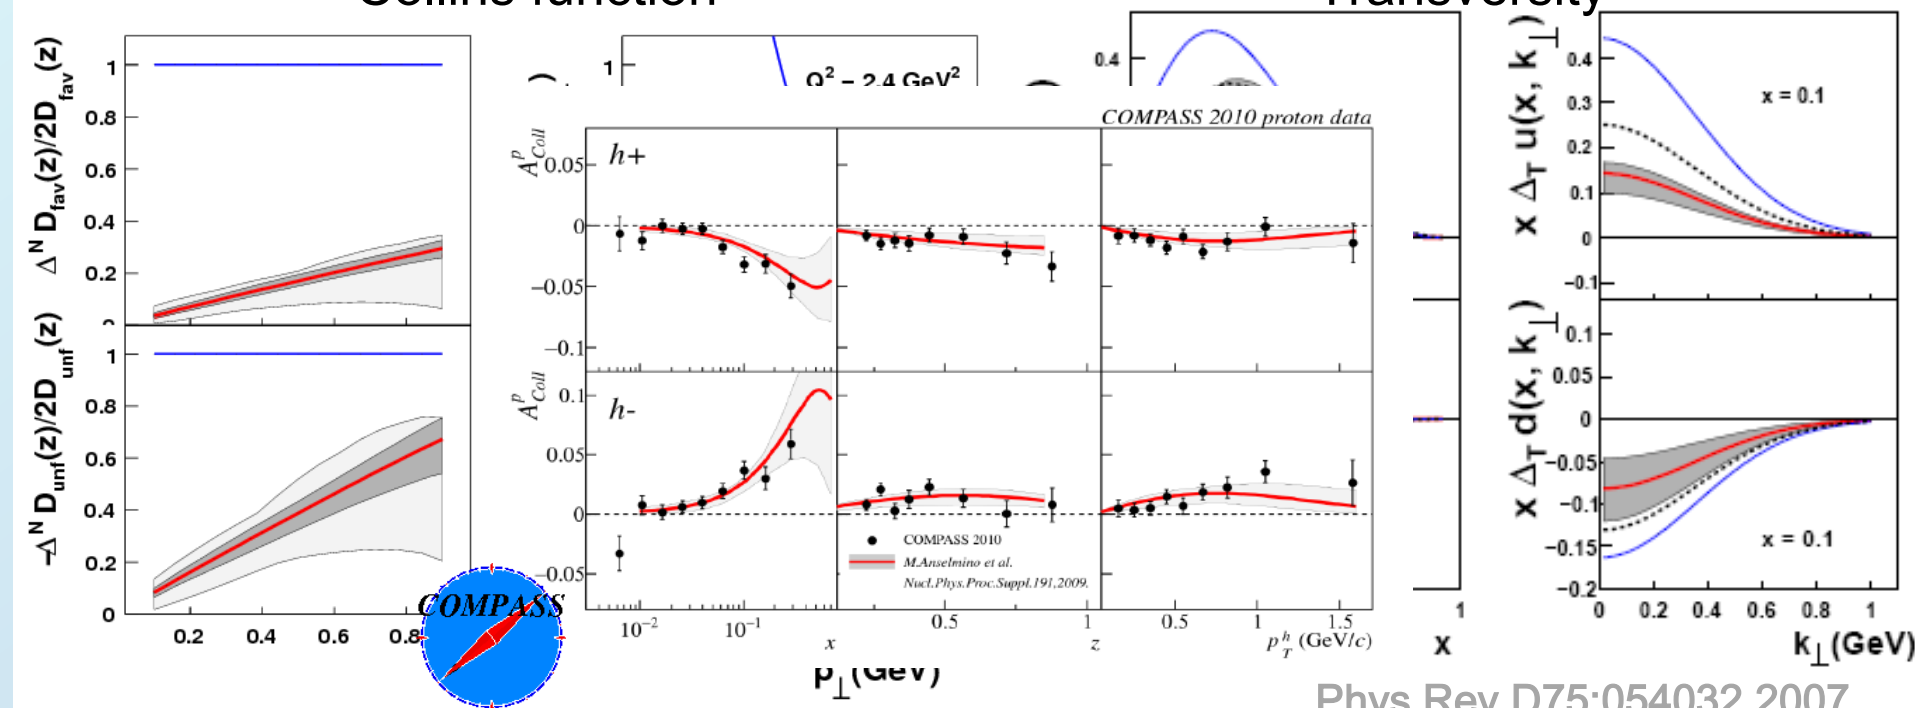

RS et al (Belle), PRL96: 232002  
PRD 78:032011, Erratum D86:039905

# Global Fit of Collins FF and Transversity (HERMES, COMPASS d, Belle)

Collins function

Transversity

- Latest SIDIS data not included in FIT
- Open questions:
  - TMD evolution unknown (however from Belle to HERMES no large differences seen)
  - Kt dependence from Assumption (Belle measurements planned)
- Interference FF (IFF) as independent Cross check

Phys.Rev.D75:054032,2007,  
update in  
Nucl.Phys.Proc.Suppl.191:98-  
107,2009

# Collins evolution

Kang, Prokudin, Sun and Yuan,  
arXiv:1505.05589

- First Transversity extraction taking TMD evolution into account
- Still many assumptions on transverse momentum dependence necessary
- Only moderate scale dependence in final results but large effect on e+e- asymmetries

# Kaons, etas and other hadrons

- Need Kaon Collins fragmentation:
  - to understand HERMES/COMPASS kaon data
  - Flavor separation of transversity
  - Inflation of FF functions:
    - $u, d \rightarrow \pi: 2$
    - $u, d, s \rightarrow \pi, K: 6+$
- Apply PID unfolding to obtain pion-pion, pion-kaon and kaon-kaon combinations
- Currently use only  $\phi_0$  method:

# Preliminary results

- First pion-kaon and kaon-kaon Collins results.
- Pion-pions consistent with previous results
- Pion-pion and kaon-kaon of similar shape and magnitude
- Pion-kaon substantially smaller

Charm contribution not corrected

# Kaon Collins vs $P_T$

- Asymmetries (integrated over  $z$ ) increasing with transverse momentum
- Asymmetries on light neutral hadron - pion combinations forthcoming

# Interference fragmentation

- Again azimuthal anisotropy of distribution of hadron pairs wrt transverse quark spin
- Collinear treatment of interference fragmentation → evolution known (Ceccopieri et al: **Phys.Lett. B650 (2007) 81-89**)

# Interference Fragmentation (IFF) in $e^+e^-$

- $e^+e^- \rightarrow (\pi^+\pi^-)_{\text{jet1}}(\pi^+\pi^-)_{\text{jet2}}X$
- Theoretical guidance by papers of Boer, Jakob, Radici [PRD 67,(2003)] and Artru, Collins [ZPhysC69(1996)]
- Early work by Collins, Heppelmann, Ladinsky [NPB420(1994)]

Model predictions by:

- Jaffe et al. [PRL 80,(1998)]
- Radici et al. [PRD 65,(2002)]

$$A \propto H_1^<(z_1, m_1) \bar{H}_1^<(z_2, m_2) \cos(\varphi_1 + \varphi_2)$$

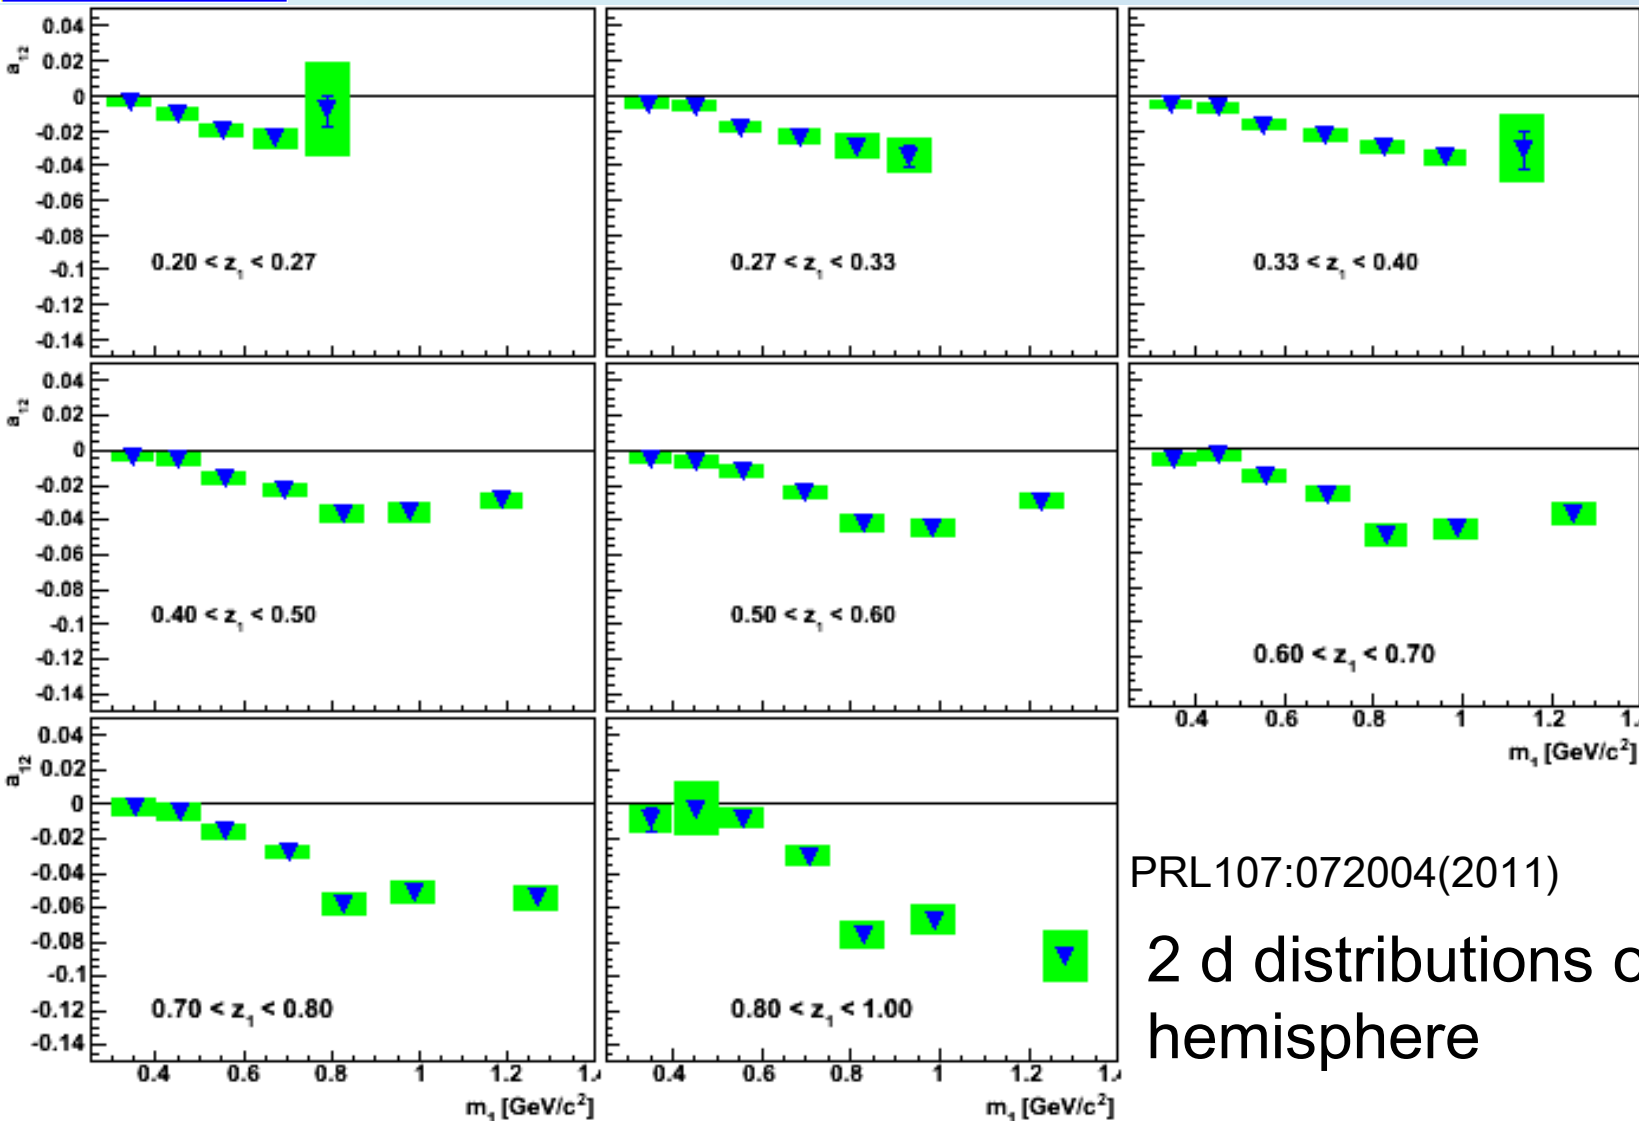

# Belle IFF asymmetries: $(z_1 \times z_2)$ Binning

Magnitude increasing with  $z$

# Belle IFF asymmetries: $(z_1 \times m_1)$ Binning

PRL107:072004(2011)

2 d distributions of one hemisphere

# First transversity extraction from HERMES, COMPASS and Belle IFF data

Using Belle IFF and **HERMES** or **COMPASS** to extract transversity compared to Collins FF based global analysis:

Courtoy, Bacchetta, Radici:  
Phys.Rev.Lett. 107 (2011) 012001 and  
[arXiv:1206.1836](https://arxiv.org/abs/1206.1836)  
HERMES: JHEP 0806 (2008)  
COMPASS: Phys.Lett. B713 (2012)

- recent IFF analysis and Collins Transversity comparable  
→ CollinsFF evolution weak?
- But many assumptions at this point
- STAR and PHENIX Preliminary data not yet used

# Exotic Fragmentation functions

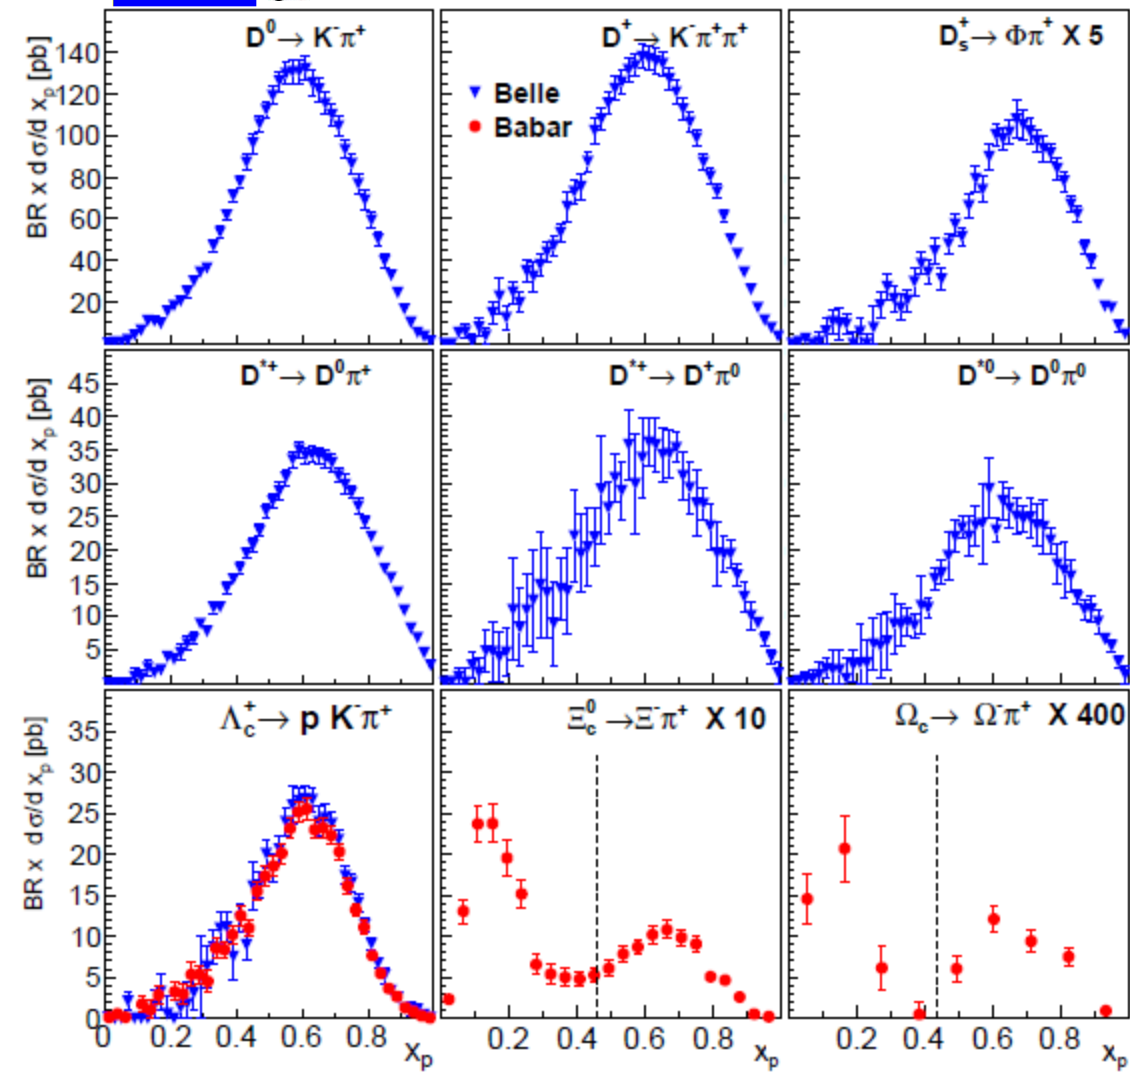

Kumano (KEK) FF12 and PRD77(2008)017504

- General Idea: Use large difference between favored (valence) and disfavored (sea) of hadrons to find valence structure of potentially exotic hadrons, eg  $f_0(980)$ :

Type	Configuration	2nd Moment	Peak $z$
Nonstrange $q\bar{q}$	$(u\bar{u} + d\bar{d})/\sqrt{2}$	$M(s) < M(u) < M(g)$	$z_{\max}(s) < z_{\max}(u) \approx z_{\max}(g)$
Strange $q\bar{q}$	$s\bar{s}$	$M(u) < M(s) \lesssim M(g)$	$z_{\max}(u) < z_{\max}(s) \approx z_{\max}(g)$
Tetraquark	$(u\bar{u}s\bar{s} + d\bar{d}s\bar{s})/\sqrt{2}$	$M(u) = M(s) \lesssim M(g)$	$z_{\max}(u) = z_{\max}(s) \approx z_{\max}(g)$
$K\bar{K}$ Molecule	$(K^+K^- + K^0\bar{K}^0)/\sqrt{2}$	$M(u) = M(s) \lesssim M(g)$	$z_{\max}(u) = z_{\max}(s) \approx z_{\max}(g)$
Glueball	$gg$	$M(u) = M(s) < M(g)$	$z_{\max}(u) = z_{\max}(s) < z_{\max}(g)$

# Charmed Fragmentation

PRL.95, 142003 (2005)(Babar)  
 PRD73, 032002 (2006) (Belle)  
 PRD75, 012003 (2007)(Babar)  
 PRL 99, 062001 (2007)(Babar)

- Heavier particles generally plotted vs normalized momentum  $x_p = \frac{P^h}{P_{max}^h}$
- Unlike light hadrons charmed hadrons contain large fraction of charm quark momentum

## SIDIS

## pp collisions

## e<sup>+</sup>e<sup>-</sup> Annihilation

# Access to FFs

## • SIDIS:

$$\sigma^h(x, z, Q^2, P_{h\perp}) \propto \sum_q e_q^2 q(x, k_t, Q^2) D_{1,q}^h(z, p_t, Q^2)$$

- Relies on unpol PDFs
- Parton momentum known at LO
- Flavor structure directly accessible
- Transverse momenta convoluted between FF and PDF

## • pp:

$$\sigma^h(P_T) \propto \int_{x_1, x_2, z} \sum_{a, a' \in q, g} f_a(x_1) \otimes f_{a'}(x_2) \otimes \sigma_{aa'} \otimes D_{1,q}^h(z)$$

- Relies on unpol PDFs
- leading access to gluon FF
- Parton momenta not directly known

## • e<sup>+</sup>e<sup>-</sup>:

$$\sigma^h(z, Q^2, p_t) \propto \sum_q e_q^2 (D_{1,q}^h(z, p_t, Q^2) + D_{1,\bar{q}}^h(z, p_t, Q^2))$$

- No PDFs necessary
- Clean initial state, parton momentum known at LO
- Flavor structure not directly accessible

# KEKB: $L > 2.1 \times 10^{34} \text{ cm}^{-2} \text{ s}^{-1}$ !!

- Asymmetric collider
- $8 \text{ GeV } e^- + 3.5 \text{ GeV } e^+$
- $\sqrt{s} = 10.58 \text{ GeV } (Y(4S))$
- $e^+e^- \rightarrow Y(4S) \rightarrow B \bar{B}$
- Continuum production:  
 $10.52 \text{ GeV}$
- $e^+e^- \rightarrow q \bar{q} \text{ (u,d,s,c)}$
- Integrated Luminosity:  $> 1000 \text{ fb}^{-1}$
- $> 70 \text{ fb}^{-1} \Rightarrow$  continuum

Main research at Belle:  
CP violation and  
determination of Cabibbo  
Kobayashi Maskawa  
(CKM) matrix
