- 1 Brief introduction to neutrino mass models
- 2 The Zee model and its connection to HLFV
- 3 Results from a parameter scan
- 4 Summary and conclusions

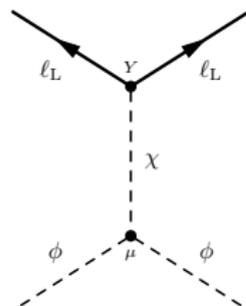

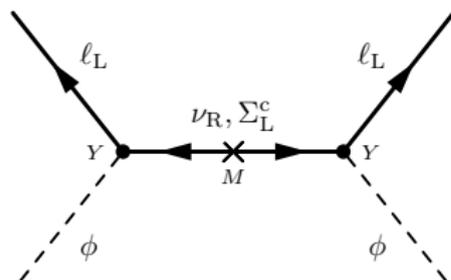

# Brief introduction to neutrino masses

# The Weinberg operator: tree level completions– seesaws

- There is only one dimension 5 EFT operator, with  $\Delta L = 2$ .
- It generates Majorana neutrino masses ( $\alpha, \beta$  flavour indices):

$$\mathcal{O}_5 = \frac{1}{2} \frac{c_{\alpha\beta}}{\Lambda} (\overline{L}_\alpha \tilde{\Phi}) (\Phi^\dagger \tilde{L}_\beta) + \text{H.c.} \quad \longrightarrow \quad m_\nu = c \frac{v^2}{\Lambda}.$$

- Left) a  $Y = 0$  heavy fermion singlet (triplet), type I (III) seesaw.
- Right) a  $Y = 1$  heavy scalar triplet, type II seesaw.

- 1 Positive points: SO(10) embedding, Leptogenesis.
- 2 Drawbacks: typically difficult to test, problem of hierarchies.

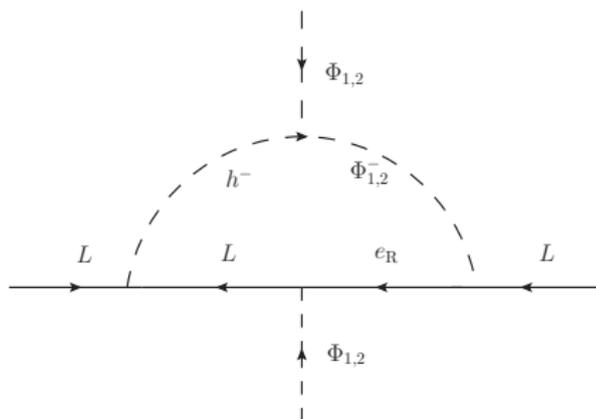

# Radiative models: an example, the Zee model

[Zee, Cheng, Babu, Wolfenstein, Petcov, Kanemura, Farzan, Cai, Aristizabal, He, JHG...]

- Main idea:  $\nu$  are massless at tree level,  $m_\nu$  generated radiatively.
- Review to appear soon by Cai, Schmidt, Vicente, Volkas and JHG.
- An example is the Zee model, which adds to the SM content an extra Higgs doublet  $\Phi_2$  and a new singly-charged SU(2) singlet  $h^+$ :

$$\mathcal{L}_Y \subset -\bar{L}(Y_1^\dagger \Phi_1 + Y_2^\dagger \Phi_2)e_R - \bar{L}f Lh^+ + \mu\epsilon_{\alpha\beta}H_1^\alpha H_2^\beta h^- + \text{H.c.}$$

- $\Delta L = 2$  by the presence of  $Y_1$ ,  $Y_2$ ,  $f$ , and  $\mu$ . At one loop:

# The Zee model and its connection to HLFV

# The scalar sector

- Most general potential in the Higgs basis ( $\langle H_1^0 \rangle = v/\sqrt{2}$ ,  $\langle H_2^0 \rangle = 0$ ):

$$\begin{aligned} V = & \mu_1^2 H_1^\dagger H_1 + \mu_2^2 H_2^\dagger H_2 - \left( \mu_3^2 H_2^\dagger H_1 + \text{H.c.} \right) + \frac{1}{2} \lambda_1 \left( H_1^\dagger H_1 \right)^2 \\ & + \frac{1}{2} \lambda_2 \left( H_2^\dagger H_2 \right)^2 + \lambda_3 \left( H_1^\dagger H_1 \right) \left( H_2^\dagger H_2 \right) + \lambda_4 \left( H_1^\dagger H_2 \right) \left( H_2^\dagger H_1 \right) \\ & + \left\{ \frac{1}{2} \lambda_5 \left( H_1^\dagger H_2 \right)^2 + \left[ \lambda_6 \left( H_1^\dagger H_1 \right) + \lambda_7 \left( H_2^\dagger H_2 \right) \right] H_1^\dagger H_2 + \text{H.c.} \right\} \\ & + \mu_h^2 |h^+|^2 + \lambda_h |h^+|^4 + \lambda_8 |h^+|^2 H_1^\dagger H_1 + \lambda_9 |h^+|^2 H_2^\dagger H_2 \\ & + \lambda_{10} |h^+|^2 \left( H_1^\dagger H_2 + \text{H.c.} \right) + \left( \mu \epsilon_{\alpha\beta} H_1^\alpha H_2^\beta h^- + \text{H.c.} \right) \end{aligned}$$

- The spectrum consists of two CP-even scalars ( $h$ ,  $H$ ), one CP-odd ( $A$ ), and two charged scalars  $h_{1,2}^\pm$  which mix via the  $\mu$  term:

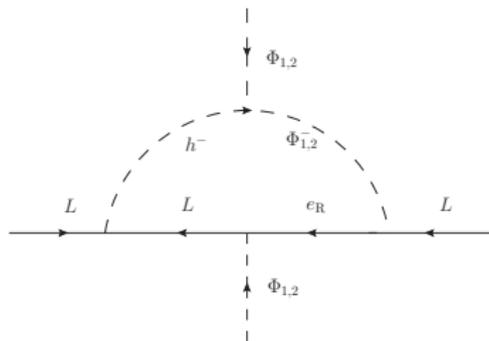

$$s_{2\varphi} = \frac{\sqrt{2}v\mu}{m_{h_2^+}^2 - m_{h_1^+}^2} .$$

# Leptonic Yukawa Lagrangian in the mass basis

In the mass basis, the most general leptonic Lagrangian reads

$$\begin{aligned} -\mathcal{L}_Y &= \bar{\nu}_L U^\dagger \left( \frac{-\sqrt{2}m_E t_\beta}{v} + \frac{Y_2^\dagger}{c_\beta} \right) e_R (c_\varphi h_1^+ - s_\varphi h_2^+) \\ &+ 2\bar{\nu}_L^c U^T f e_L (-s_\varphi h_1^+ - c_\varphi h_2^+) \\ &+ \bar{e}_L \left( \frac{-m_E s_\alpha}{v c_\beta} + c_{\beta-\alpha} \frac{Y_2^\dagger}{\sqrt{2}c_\beta} \right) e_R h \\ &+ \bar{e}_L \left( \frac{m_E c_\alpha}{v c_\beta} - s_{\beta-\alpha} \frac{Y_2^\dagger}{\sqrt{2}c_\beta} \right) e_R H \\ &+ i\bar{e}_L \left( -\frac{m_E t_\beta}{v} + \frac{Y_2^\dagger}{\sqrt{2}c_\beta} \right) e_R A + \text{H.c.} \end{aligned}$$

# Neutrino masses, mixings and LFV

$$\mathcal{M}_\nu = \frac{s_{2\varphi} t_\beta}{8\sqrt{2}\pi^2 v} \left( f m_f^2 + m_f^2 f^T - \frac{v}{\sqrt{2}s_\beta} (f m_f Y_2 + Y_2^T m_f f^T) \right) \ln \frac{m_{h_2^+}^2}{m_{h_1^+}^2}$$

$$\mathcal{M}_\nu \propto \begin{pmatrix} -2f^{e\tau} Y_2^{\tau e} & -f^{e\tau} Y_2^{\tau\mu} - f^{\mu\tau} Y_2^{\tau e} & \frac{\sqrt{2}s_\beta m_\tau}{v} f^{e\tau} - f^{e\tau} Y_2^{\tau\tau} \\ -f^{e\tau} Y_2^{\tau\mu} - f^{\mu\tau} Y_2^{\tau e} & -2f^{\mu\tau} Y_2^{\tau\mu} & \frac{\sqrt{2}s_\beta m_\tau}{v} f^{\mu\tau} - f^{\mu\tau} Y_2^{\tau\tau} \\ \frac{\sqrt{2}s_\beta m_\tau}{v} f^{e\tau} - f^{e\tau} Y_2^{\tau\tau} & \frac{\sqrt{2}s_\beta m_\tau}{v} f^{\mu\tau} - f^{\mu\tau} Y_2^{\tau\tau} & 2\frac{m_\mu}{m_\tau} f^{\mu\tau} Y_2^{\mu\tau} \end{pmatrix}.$$

Reproducing correctly neutrino mixings implies  $Y_2^{e\tau}, Y_2^{\mu\tau} \neq 0$ , so:

- We expect sizable LFV rates mediated by  $Y_2$ :  $h \rightarrow \tau\mu, \tau \rightarrow \mu\gamma$ .

# HLFV as a test of new physics beyond the SM

Observable	ATLAS	CMS
$\text{Br}(h \rightarrow \tau\mu)$	1.43 %	0.25 %
$\text{Br}(h \rightarrow \tau e)$	1.04 %	0.61 %

- In the SM, Higgs couplings to charged leptons are diagonal. HLFV occurs at  $D = 6$  via (also derivative ops. like  $(\bar{e}_R \Phi^\dagger) C_{Di} i \not{D}(e_R \Phi)$ ):

$$\mathcal{O}_Y = \bar{L} C_Y e_R \Phi (\Phi^\dagger \Phi).$$

- Yukawas to leptons are not diagonal in the mass basis:

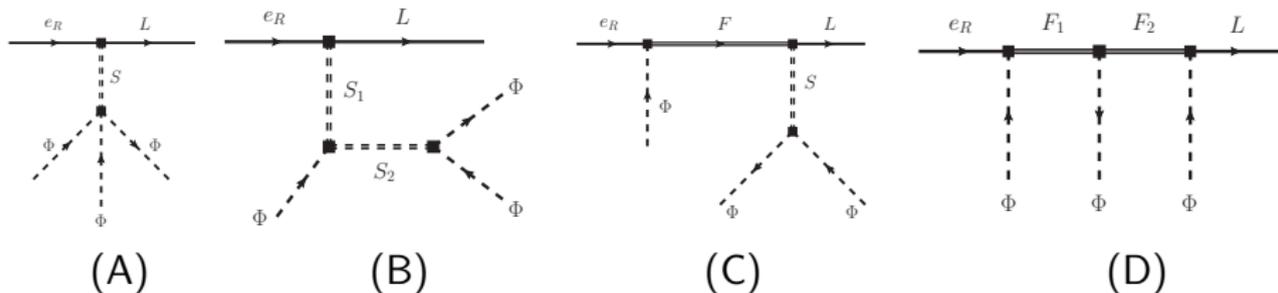

$$(y_e)_{ij} = \frac{m_i}{v} \delta_{ij} + (C_Y)_{ij} \frac{v^2}{\sqrt{2}\Lambda^2}, \quad \bar{C}_Y \equiv \sqrt{|(C_Y)_{\tau\mu}|^2 + |(C_Y)_{\mu\tau}|^2}.$$

- HLFV is given by:

$$\text{BR}(h \rightarrow \tau\mu) = \frac{m_h}{8\pi\Gamma_h} \bar{y}^2, \quad \bar{y} \equiv \bar{C}_Y \frac{v^2}{\sqrt{2}\Lambda^2}.$$

# HLFV UV completions of $\mathcal{O}_Y$ at tree level

[Rius, Santamaria and JHG, JHEP 1611 (2016) 084, arXiv: 1605.06091]

- Topology A (also B) is a two-Higgs doublet, with possible large HLFV.
- Topology C and D with VLL predict very small HLFV,  $< 10^{-6}$ .

HLFV in 2HDM (topology A) like for the Zee model is given by:

$$\text{BR}(h \rightarrow \mu\tau) = \frac{m_h}{8\pi\Gamma_h} \left( \frac{c_{\beta-\alpha}}{\sqrt{2}c_\beta} \right)^2 (|Y_2^{\tau\mu}|^2 + |Y_2^{\mu\tau}|^2).$$

→ Need parameter scan of the Zee model to predict HLFV and CLFV.

# Results from a parameter scan

JHEP 1704 (2017) 130, arXiv: 1701.05345

# Free parameters of the scan

[T. Ohlsson, S. Riad, J. Wiren and JHG, JHEP 1704 (2017) 130, arXiv: 1701.05345]

We used MULTINEST to scan over the 19 free parameters of the model:

Parameter	Prior
Complex: $Y_2^{\tau\tau}, Y_2^{\tau\mu}, Y_2^{\tau e}, Y_2^{\mu\tau}$	$[10^{-12}, 10^{-1}]$
Real: $f^{\mu\tau}, f^{e\tau}, Y_2^{e\tau}$	$[10^{-12}, 10^{-1}]$
$\tan\beta$	$[0.3, 50]$
$\lambda_1, \lambda_2,  \lambda_3 ,  \lambda_5 $	$[10^{-5}, \sqrt{4\pi}]$
$\mu_h, \mu_2$ [GeV]	$[1, 10^7]$
$\mu$ [GeV]	$[1, 10^7]$

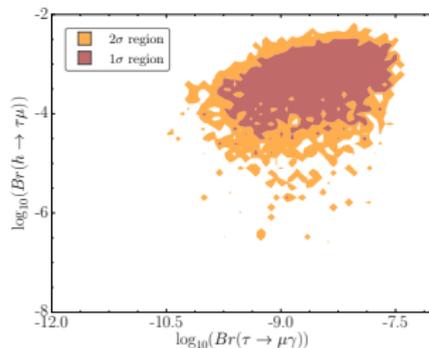

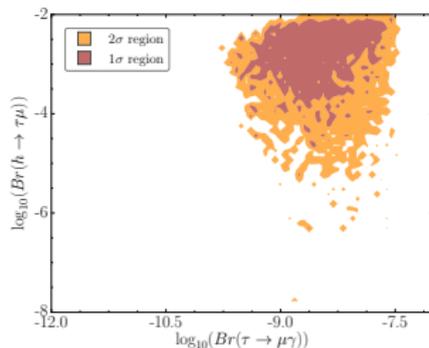

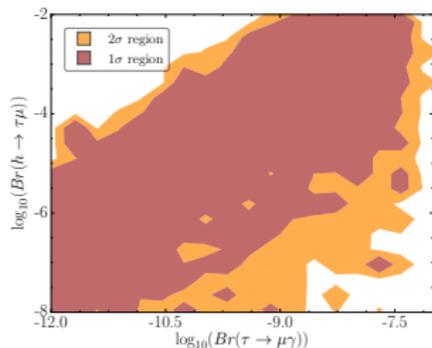

We show the one and two sigma profile likelihoods for:

- no neutrino masses ( $\mu = 0$ )
- neutrino masses ( $\mu \neq 0$ ) in:
  - ① Normal Ordering (NO)
  - ② Inverted Ordering (IO)

$\mu = 0$

NO

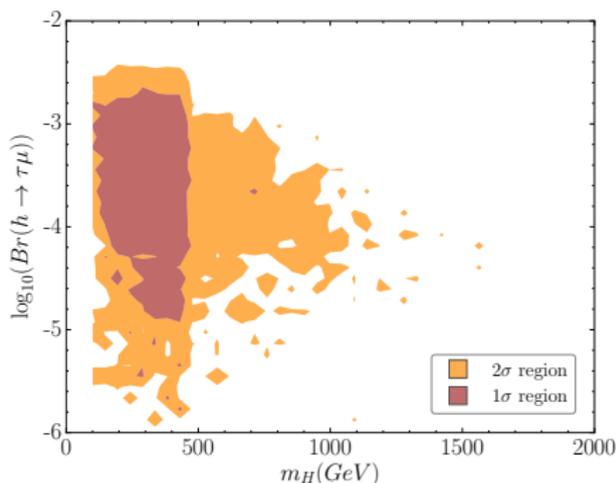

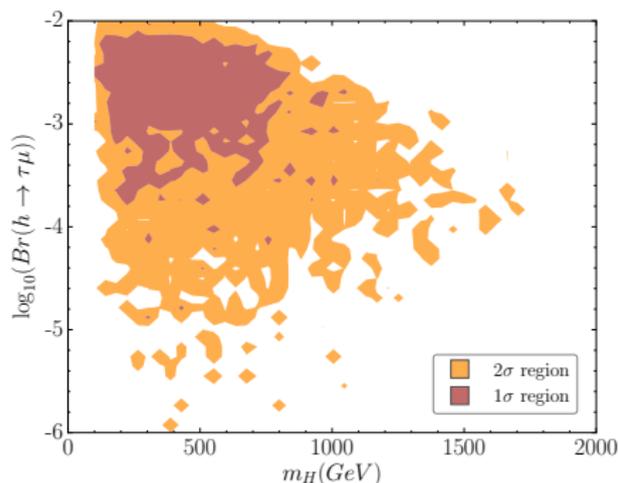

IO

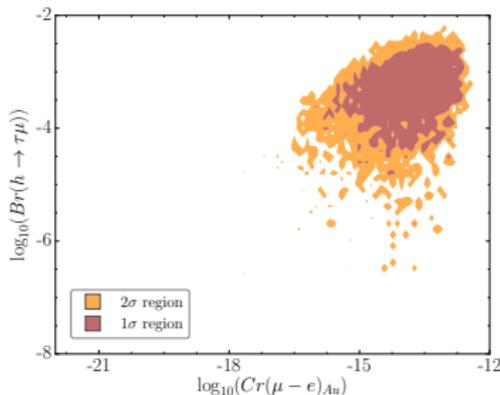

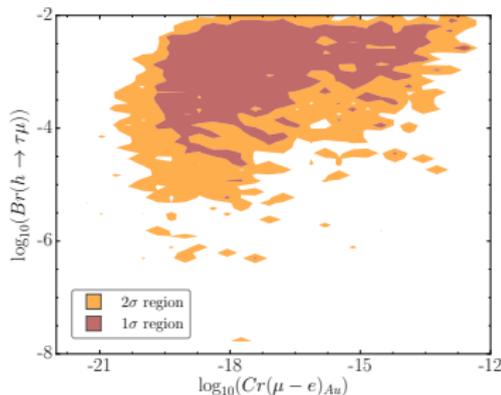

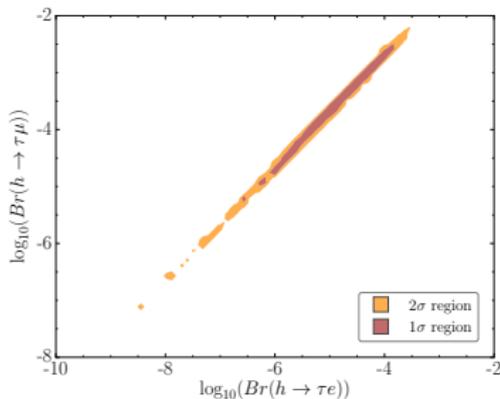

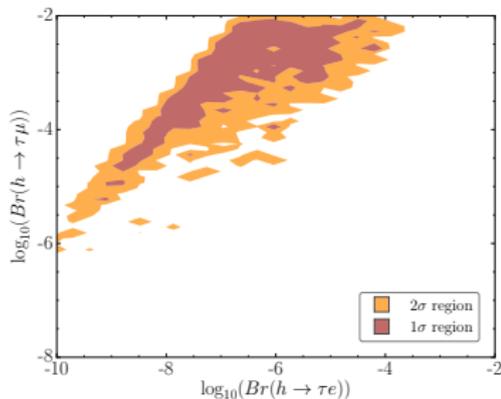

# Decoupling of $h \rightarrow \tau\mu$ with $m_H$ (NO left, IO right)

Having a sufficiently SM-like Higgs boson as observed demands  $s(\beta - \alpha) \approx 1$  (alignment limit). Expanding around  $\beta - \alpha \approx \pi/2$ :

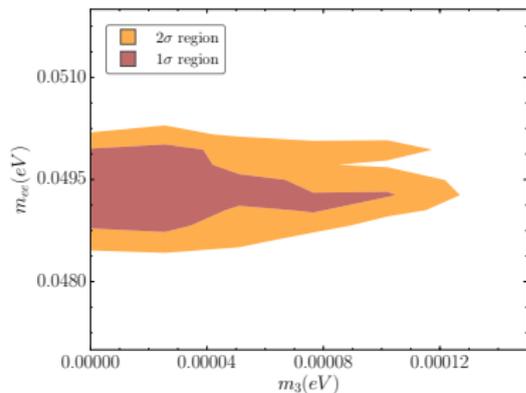

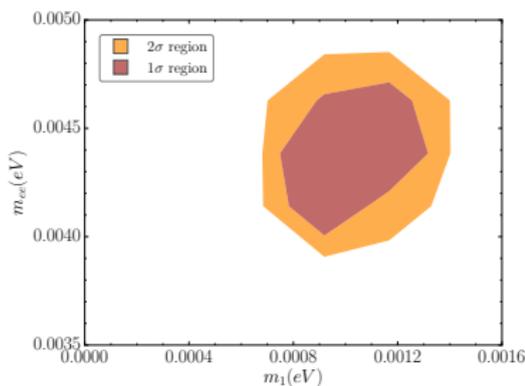

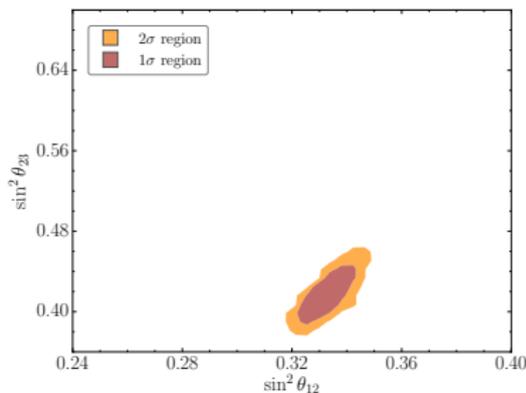

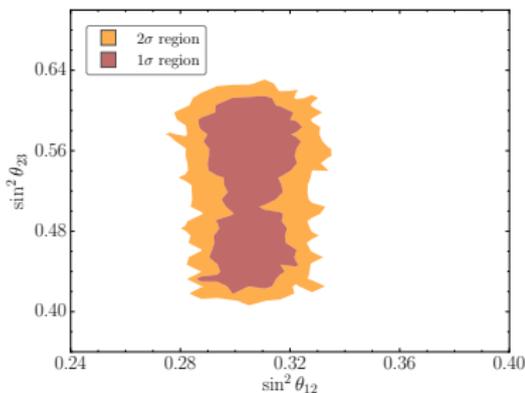

$$\text{Br}(h \rightarrow \tau\mu) \simeq \frac{m_h}{16\pi\Gamma_h} \frac{\lambda_6^2 v^4}{c_\beta^2 m_H^4} (|Y_2^{\tau\mu}|^2 + |Y_2^{\mu\tau}|^2).$$

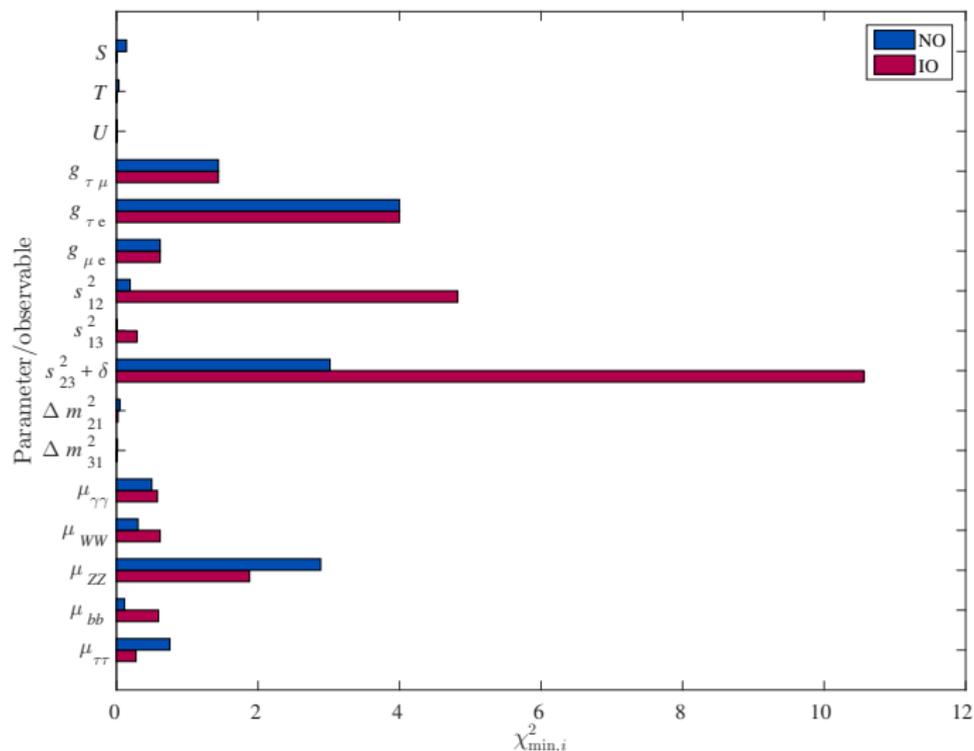

# Other HLFV and CLFV processes (NO left, IO right)

# Neutrino mixings, lightest mass, $m_{ee}$ (NO left, IO right)

# Individual contributions to the $\Delta\chi^2$

# Naturality limits from the Higgs mass. 95 % C.L. results

- $m_h$  gets a correction  $\delta m_h \propto \mu$ . Demanding  $\delta m_h/m_h \lesssim \kappa$ :

$$\mu \lesssim \kappa \frac{4\pi m_h}{s_{\beta-\alpha}} \simeq 1.5 \left( \frac{\kappa}{s_{\beta-\alpha}} \right) \text{ TeV}.$$

- $\kappa = 1$  (10) corresponds to *no* (10 %) fine-tuning.

Quantity	NO		IO

## Summary and conclusions

# Summary and conclusions

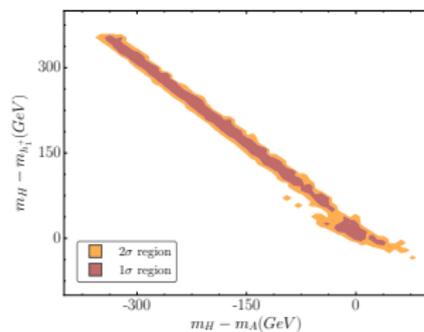

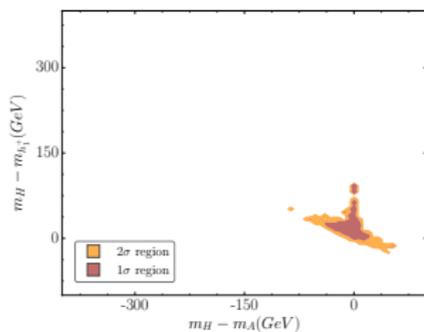

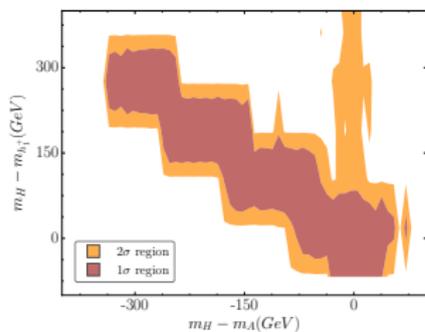

- 1 Radiative models are a simple explanation for the lightness of neutrino masses, with no large hierarchies, and testable.
- 2 HLFV implies BSM physics, maybe related to neutrino masses.
- 3 The Zee model is a simple explanation for neutrino masses with HLFV at tree level. The main results from the parameter scan are:
  - Large  $h \rightarrow \tau\mu$  is possible.
  - NO gives a good fit, IO is disfavoured.
  - If  $\theta_{23}$  happens to be in the second octant, then IO will be excluded.
  - One massless neutrino only compatible with IO.
  - Scalar masses have to be below  $\sim 2$  TeV, accessible at the LHC.
  - Future  $\tau \rightarrow \mu\gamma$  ( $\mu e$  conversion) can test NO (IO).

# Back-up slides

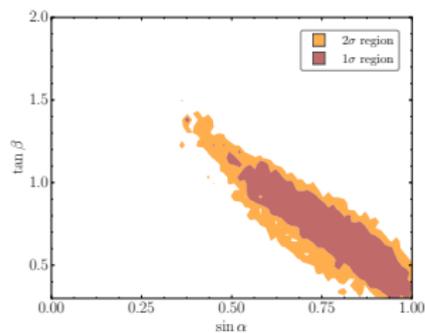

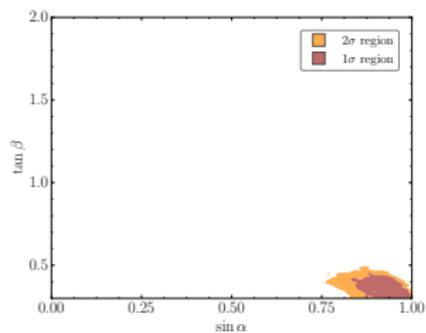

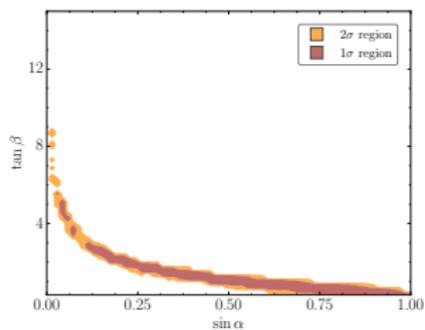

# Yukawa couplings, charged mixing angle (NO left, IO right)

# Splittings of the scalar masses ( $\mu = 0$ , NO left, IO right)

# $\sin \alpha$ and $\tan \beta$ ( $\mu = 0$ , NO left, IO right)

- After SSB,  $\langle \Phi_0 \rangle = (h + v)/\sqrt{2}$ , diagonalize  $M_e$ :

$$(M_e)_{ii} \equiv \text{diag}(m_e, m_\mu, m_\tau) = \frac{1}{\sqrt{2}} V_L^\dagger \left( Y_e + C_Y \frac{v^2}{2\Lambda^2} \right) V_R v.$$

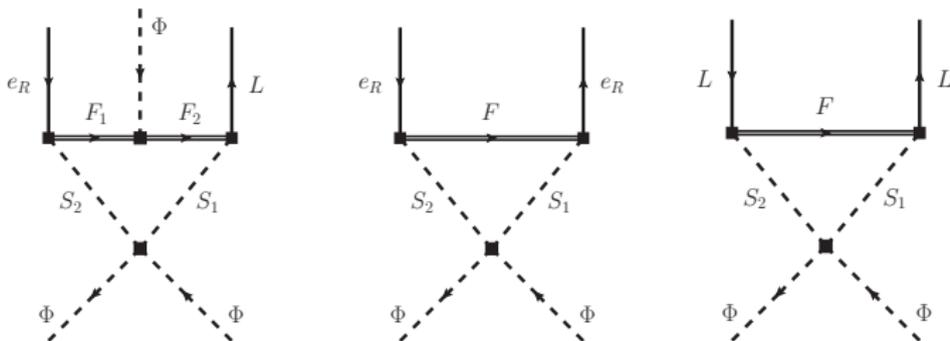

- Yukawas are no longer diagonal ( $V_L^\dagger C_Y V_R \approx C_Y$ ):

$$(y_e)_{ij} = \frac{m_i}{v} \delta_{ij} + (C_Y)_{ij} \frac{v^2}{\sqrt{2}\Lambda^2}, \quad \bar{C}_Y \equiv \sqrt{|(C_Y)_{\tau\mu}|^2 + |(C_Y)_{\mu\tau}|^2}.$$

- HLFV is given by:

$$\text{BR}(h \rightarrow \tau\mu) = \frac{m_h}{8\pi\Gamma_h} \bar{y}^2, \quad \bar{y} \equiv \bar{C}_Y \frac{v^2}{\sqrt{2}\Lambda^2}.$$

# Neutrino mass models typically generate HLFV at one loop

Top.	Part.	Representations	Neutrino mass models
LR	S, F	$(1, 0)_F, (3, 0)_F$	Dirac, SSI/III (ISS)
RR	S	$(1, 2)_S$	ZB (doubly-charged $k^{++}$ )
LL	S	$(1, 1)_S, (3, 1)_S$	ZB (singly-charged $h^+$ ), SSII
LL ( $Z_2$ )	$S \oplus F$	$(1, 1/2)_S \oplus (1, 0)_F, (3, 0)_F$	Scotogenic Model

→ In the Zee-Babu (with  $\lambda_{h\Phi}|h^+|^2\Phi^\dagger\Phi + \lambda_{k\Phi}|k|^2\Phi^\dagger\Phi + \text{h.c.}$ ):

$$A_{\text{ZB}}^{h \rightarrow \tau\mu} \sim \frac{m_\tau v}{(4\pi)^2} \left( \frac{\lambda_{h\Phi}}{m_{h^+}^2} (f_{e\mu}^* f_{e\tau}) + \frac{\lambda_{k\Phi}}{m_k^2} (g_{e\mu}^* g_{e\tau} + g_{\mu\mu}^* g_{\mu\tau} + g_{\mu\tau}^* g_{\tau\tau}) \right).$$

# HLFV rates at one loop

- We can estimate HLFV in previous neutrino mass models:

$$\text{BR}(h \rightarrow \mu\tau) \sim \text{BR}(h \rightarrow \tau\tau) \frac{\lambda_{ih}^2}{(4\pi)^4} \left(\frac{v}{\text{TeV}}\right)^4 \left(\frac{Y}{M_i/\text{TeV}}\right)^4.$$

- $\tau \rightarrow \mu\gamma$  typically gives the constraint:

$$\left(\frac{Y}{M_i/\text{TeV}}\right)^4 \lesssim \mathcal{O}(0.01 - 1) \quad \longrightarrow \quad \text{BR}(h \rightarrow \mu\tau) \lesssim 10^{-8}.$$

Can  $\text{BR}(h \rightarrow \mu\tau)$  be large, overcoming the loop  $\sim 1/(4\pi)^4$ ?

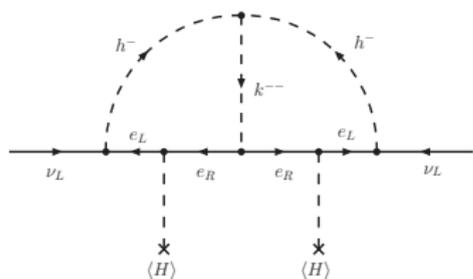

- Evade CLFV? NO, some of the new F and S in the loop are charged. One expects CLFV at the same level as HLFV [Dorsner].
- Large Yukawas with special textures:  $\text{BR} \lesssim 10^{-5}$  [ISS, Arganda].
- But: large  $Y, \lambda$  lead to instabilities/non-perturbative and  $h \rightarrow \gamma\gamma$ .

→ **Does any neutrino mass model generate HLFV at tree level?**

- Prototype example: the Zee-Babu model, which adds a singly- and a doubly-charged scalar  $h^\pm, k^{\pm\pm}$ .  $\Delta L = 2$  in the  $\mu$  term:

$$\mathcal{L}_{\text{ZB}} \subset \bar{L} Y e_R \Phi + \bar{\tilde{L}} f L h^+ + \bar{e}_R^c g e_R k^{++} + (\mu h^2 k^{++} + \text{H.c.}).$$

- Neutrino masses are generated at two loops:

$$\mathcal{M}_\nu = \frac{v^2 \mu}{48\pi^2 M^2} \tilde{I} f Y g^\dagger Y^T f^T,$$

$$M \equiv \max(m_h, m_k).$$

## Clear predictions:

- $f$  is AS  $\rightarrow \det f = 0 \rightarrow \det \mathcal{M}_\nu = 0$ , so one  $\nu$  is massless.
- $k^{++}$  can be light enough to be searched for at the LHC.

# Zee-Babu strongest constraints: CLFV and universality

- $|V_{ud}^{exp}|^2 + |V_{us}^{exp}|^2 + |V_{ub}^{exp}|^2 = 0.9999 \pm 0.0006$   
 $\approx 1 - \frac{\sqrt{2}}{G_F m_h^2} |f_{e\mu}|^2 \rightarrow |f_{e\mu}|^2 < 0.007 \left(\frac{m_h}{\text{TeV}}\right)^2$

- $\tau/\mu$  universality:  $\frac{G_\tau^{exp}}{G_\mu^{exp}} = 0.9998 \pm 0.0013$   
 $||f_{e\tau}|^2 - |f_{e\mu}|^2| < 0.035 \left(\frac{m_h}{\text{TeV}}\right)^2$

- $\text{BR}(\tau \rightarrow \mu\gamma) < 4.4 \times 10^{-8}$   
 $\frac{|f_{e\tau}^* f_{\mu\tau}|^2}{(m_h/\text{TeV})^4} + \frac{16|g_{ee}^* g_{e\mu} + g_{e\mu}^* g_{\mu\mu} + g_{e\tau}^* g_{\mu\tau}|^2}{(m_k/\text{TeV})^4} < 0.7$

- $\text{BR}(\tau^- \rightarrow \mu^+ \mu^- \mu^-) < 2.1 \times 10^{-8}$   
 $|g_{\mu\tau} g_{\mu\mu}^*| < 0.008 \left(\frac{m_k}{\text{TeV}}\right)^2$
