

# Status of BLAH

*Francesco Prelz ([francesco.prelz@mi.infn.it](mailto:francesco.prelz@mi.infn.it))*

*JRA1 All-Hands meeting, Nicosia, May 6<sup>th</sup>, 2009*

- **Both stable (currently v1.12.x) and unstable (currently v1.13.y) versions of ‘org.glite.ce.blahp’ are maintained.**
  - The stable branch should see just bug fixes
  - The unstable branch is for previewing features of the next stable version series
- **Currently supported batch systems: PBS, LSF and Condor**
  - For PBS and LSF: remote log parser servers on the batch system servers can be deployed to expedite status retrieval.
  - Condor support is achieved via local ‘job registry’ and local commands only.
- **Integrated with both CREAM and Condor (where it serves as ‘the’ interface to batch systems).**

- **Due to appear in the 1.14.x stable series (timeframe: end of May):**
  - Support of SGE (er, should it be called OGE already ?) as contributed by CESGA.
  - Support of all batch systems via local job registry (for efficient status queries without log parser support)
  - Support of multiple user-mapping mechanism (currently glxexec and sudo)
  - Support of proxy subject storage in registry (for Christoph Witzig's favourite lookup-by-subject tool)
  - Command line tool to look jobs up by proxy subject, as requested by Christoph Witzig.
  - More extended support of local submit command parameter setup.
