The Compact Muon Solenoid Detector

Piotr Traczyk
Torino/CERN
CMS detector overview
The CMS Solenoid

- CMS is built around a superconducting solenoid generating a magnetic field of 4 Tesla
- The current necessary for this - 20 kA...
- Superconducting NbTi wire cooled to ~4K
- 13m length, 6m inner diameter - enough to fit the tracker and calorimeters inside
- (cost ~80 MCHF)
Magnets in particle detectors

Particle identification in CMS
The Inner Tracker

- Measures the trajectories of charged particles
  \[ \text{momentum} = \frac{1}{\text{curvature}} \]
- The biggest silicon detector in history, over \(220 \text{m}^2\) of silicon
- Inner part – 3 layers of pixel detectors, outer part 10-11 layers of silicon microstrips
- 75,141 millions of read-out channels
Event "pile-up"

In the LHC, several proton-proton collisions can occur in a single bunch crossing (The image shows an event with 29 reconstructed vertices)
Electromagnetic Calorimeter

- Electron and photon energy measurement
- $\sim 75,000 \text{ PbWO}_4$ crystals
- Homogeneous detector - crystals act as both the absorber and the scintillator
- Very good energy resolution

![Graph showing events vs. $m_{\gamma\gamma}$ (GeV) for CMS Preliminary with data points and fitted curves.](image)
Figure 2: A section through one quadrant of the ECAL.
Hadron Calorimeter

- Jet energy measurement
- Brass absorber interleaved with scintillator layers
- Steel blocks with embedded quartz fibers in the "forward" part
The Muon System - Drift Tubes

- Muon trajectory measurement (barrel)
- Measured quantity - drift time of electrons produced by the passing muon
- Known drift velocity $\rightarrow$ distance measurement ($\sim$50-200\,µm precision)
- **Alignment** very important
**Trigger**

**Level-1 trigger. 40 MHz input:**
- Specialized processors (25 ns pipelined, latency < 1 s)
- Local pattern recognition and energy evaluation on prompt macro-granular information from calorimeter and muon detectors
- Particle identification: high p, electron, photon, muon, jets, missing $E_T$

**High trigger levels (>1). 100 kHz input:**
- Large network of processor farms
- Clean particle signature. All detector data
- Finer granularity precise measurement
- Effective mass cuts and event topology
- Track reconstruction and detector matching
- Event reconstruction and analysis
The $H \rightarrow \gamma \gamma$ channel

One of these plots contains the (simulated) Higgs boson signal.

Can you spot it?
