Combination and QCD analysis of charm and beauty production cross-section measurements in deep inelastic ep scattering at HERA

Saturday, 13 July 2019 10:00 (15 minutes)

Measurements of open charm and beauty production cross sections in deep inelastic ep scattering at HERA from the H1 and ZEUS Collaborations are combined. Reduced cross sections are obtained in the kinematic range of negative four-momentum transfer squared of the photon $2.5 \text{ GeV}^2 \leq Q^2 \leq 2000 \text{ GeV}^2$ and Bjorken scaling variable $3 \cdot 10^{-5} \leq x_{Bj} \leq 5 \cdot 10^{-2}$. The combination method accounts for the correlations of the statistical and systematic uncertainties among the different datasets. Perturbative QCD calculations are compared to the combined data. A next-to-leading order QCD analysis is performed using these data together with the combined inclusive deep inelastic scattering cross sections from HERA. The running charm- and beauty-quark masses are determined as $m_c(m_c) = 1.290^{+0.046}_{-0.041}(\text{exp/fit})^{+0.062}_{-0.014}(\text{model})^{+0.003}_{-0.031}(\text{parameterisation}) \text{ GeV}$ and $m_b(m_b) = 4.049^{+0.104}_{-0.109}(\text{exp/fit})^{+0.090}_{-0.032}(\text{model})^{+0.001}_{-0.031}(\text{parameterisation}) \text{ GeV}$.
