

Baryon spectroscopy at Belle

Y. Kato (KMI, Nagoya University)

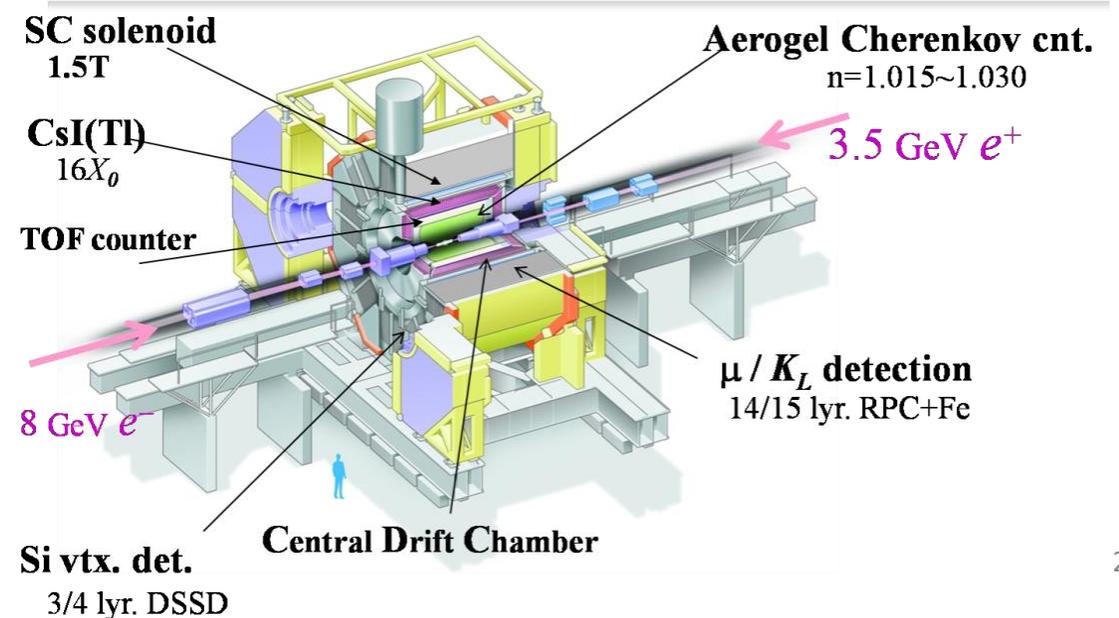

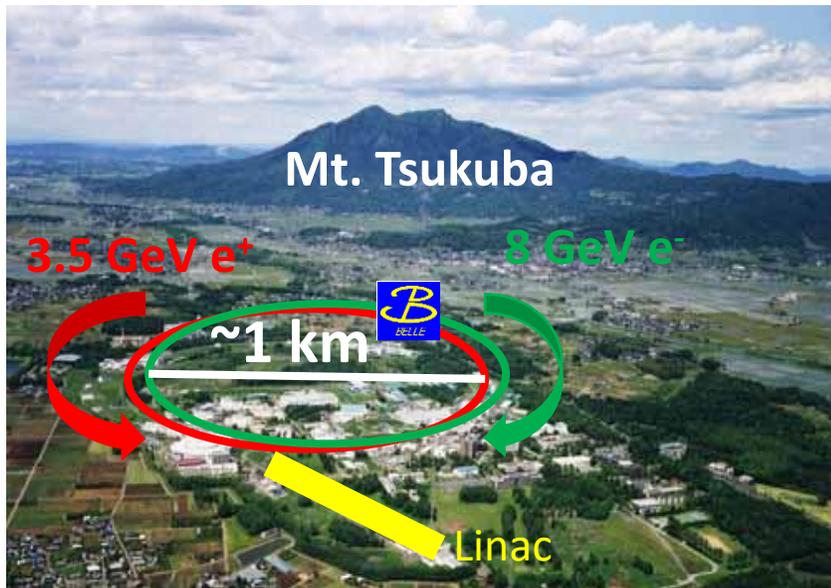

Kobayashi-Maskawa Institute
for the Origin of Particles and the Universe

KEKB/Belle experiment

- Asymmetric energy e^+e^- collider (mainly) at $Y(4S)$ mass.
- Belle: General purpose 4π detector.
- Data taking was finished in 2010:
 7.7×10^8 BB pairs, $\sim 10^9 e^+e^- \rightarrow cc^{\text{bar}}$, $>30 \text{ fb}^{-1}$ for $Y(1-3S)$

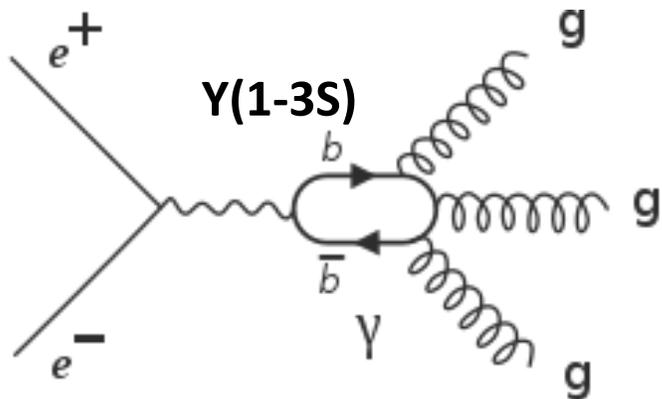

Baryon spectroscopy at B-factories (outline)

$e^+e^- \rightarrow c\bar{c}$

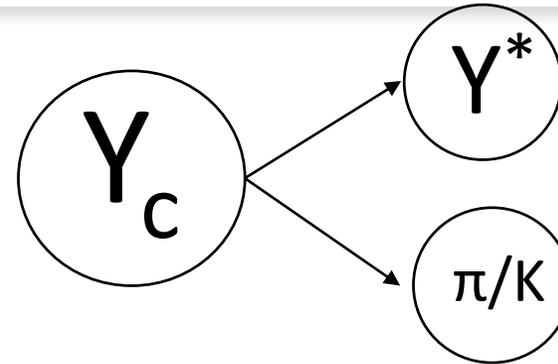

“The traditional way”

>10 new charmed baryons discovered

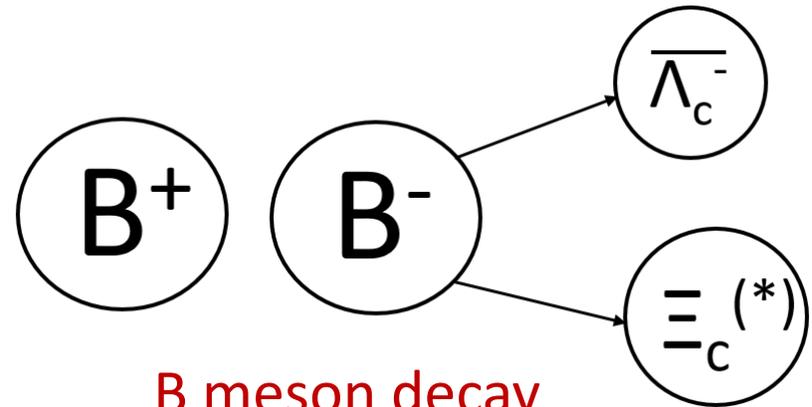

$Y(1-3S)$ decays

- 2. Observation of Ω (2012) $\rightarrow \Xi^- \pi^+$
- 3. Search for $\Omega(2012) \rightarrow \Xi(1530) \pi$

Hyperon* from charmed baryon weak decay

1. $\Xi_c^0 \rightarrow \Xi^- (1620/1690) \pi^+$

B meson decay

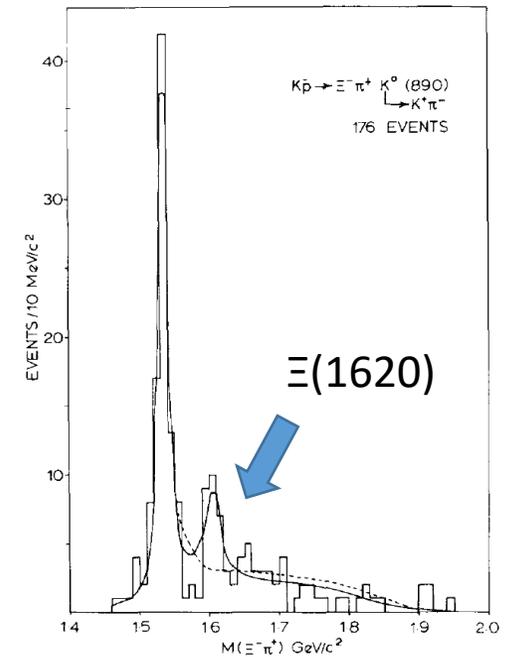

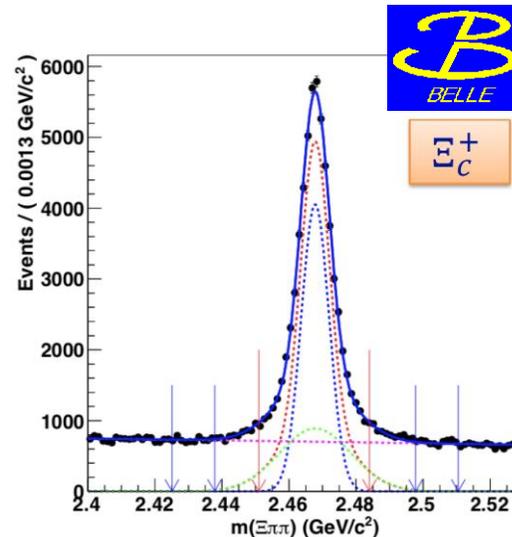

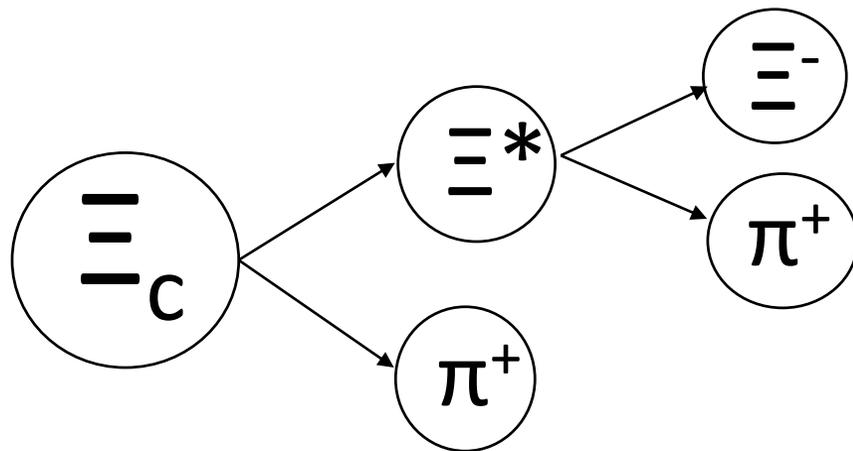

4. Ξ_c^{+0} branching fractions

$\Xi_c^+ \rightarrow \Xi(1620/1690)\pi^+, \Xi(1620/1690) \rightarrow \Xi^-\pi^+$

- Not much is known about the S=-2 baryon family(Ξ).
 - First orbital excitation with $J^P=1/2^-$ is not identified.
 - In the S=-1, $J^P=1/2^- = \Lambda(1405)$ is a candidate of meson-baryon molecule state.
 - $\Xi(1620/1690)$ are candidates of Ξ analogue of $\Lambda(1405)$.
- Evidence for $\Xi(1620)$ is poor (1 star state) in PDG.

- Belle studied Ξ^* in $\Xi_c^+ \rightarrow \Xi^*\pi, \Xi^* \rightarrow \Xi^-\pi^+ (\Xi^- \rightarrow \Lambda\pi^-)$
 $\sim 50000 \Xi_c^+ \rightarrow \Xi^-\pi^+\pi^+$ with good S/N ratio.

Old bubble chamber experiment

Phys.Lett. 38B (1972) 177-180

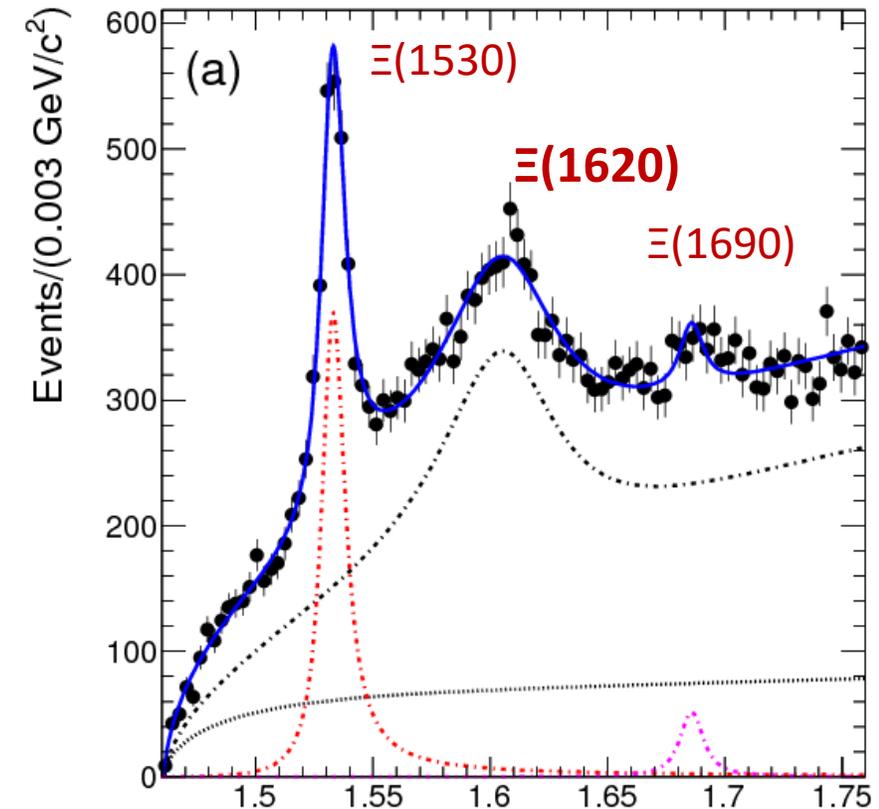

$M(\Xi^-\pi^+)$ distribution

- Peaks correspond to $\Xi(1530)$, $\Xi(1620)$, and $\Xi(1690)$ can be seen.
 - $\Xi(1620)$ and $\Xi(1690)$ are not visible in the Ξ_c sideband.
- Fit is performed with floating $\Xi(1530)$ and $\Xi(1620)$ masses/widths. $\Xi(1690)$ mass and width are fixed with PDG values.
- Interference with non-resonant S-wave component included.

	Mass (MeV/c ²)	Width (MeV)	Significance
$\Xi(1620)$	$1610.4 \pm 6.0^{+6.1}_{-4.2}$	$59.9 \pm 4.8^{+2.8}_{-7.1}$	25σ
$\Xi(1690)$	fixed	fixed	4σ

- $\Xi(1620)$ is the first hyperon established by charm baryon decay!
- Full amplitude analysis to determine J^P in the future.

[Phys. Rev. Lett. 122, 072501](#)

Observation of $\Omega(2012)$ in $Y(1-3S) \rightarrow (\Xi K) X$

- Even more less known about the Ω baryon family (=sss).
- Only **two states** established.
- Difficult to identify $\Omega(2250)$ as first P-wave excitation due to its large mass difference.
- Belle looked for Ω^* in Ξ^-K final state in **$Y(1-3S)$ data**, whose decay is flavor blind.

$\sim 600 \text{ MeV}$

Ω^-	$3/2^+$	****
$\Omega(2250)^-$		***
$\Omega(2380)^-$		**
$\Omega(2470)^-$		**

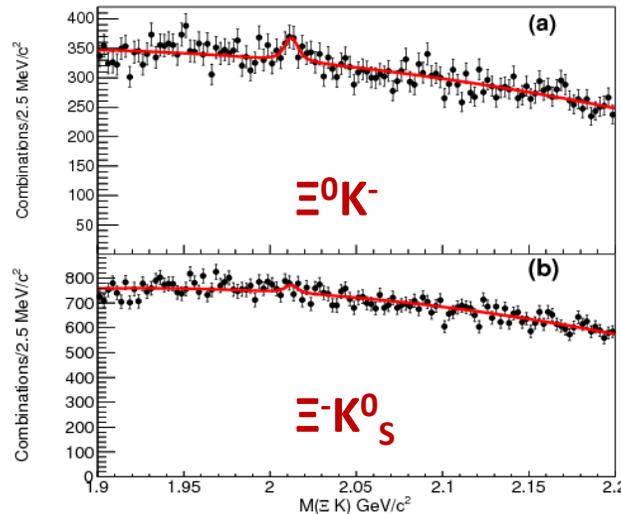

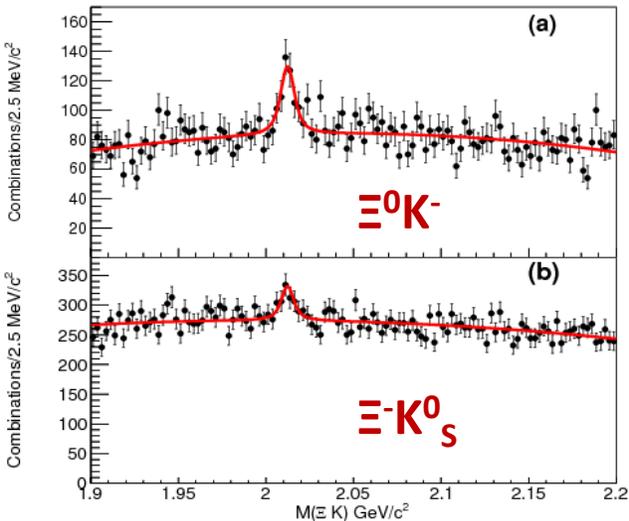

Evidence of existence is only fair

$M(\Xi K)$

Y(1-3S) data

Other (Y(4S), continuum..) data

	Y(1S)	Y(2S)	Y(3S)
Luminosity (fb ⁻¹)	5.7	24.9	2.9

- **First observation of $\Omega(2012)$ with 8.3σ**
 - Mass: $2012.4 \pm 0.7 \pm 0.6 \text{ MeV}/c^2$
 - Width: $6.4^{+2.5}_{-2.0} \pm 1.6 \text{ MeV}$.
- Consistent with P-wave ($3/2^-$) Ω state from [quark model/QCD sum rule](#), etc..

Search for $\Omega(2012)$ in $Y(1-3S) \rightarrow (\Xi(1530) K) X$

- Another possible interpretation of $\Omega(2012)$ is $\Xi(1530)K$ molecule. It is just ~ 10 MeV above the threshold.
- Large branching fraction to $\Xi(1530)K$ is predicted by several calculations.
- Search for $\Omega(2012) \rightarrow \Xi(1530) \pi$ with $Y(1-3)S$ data.

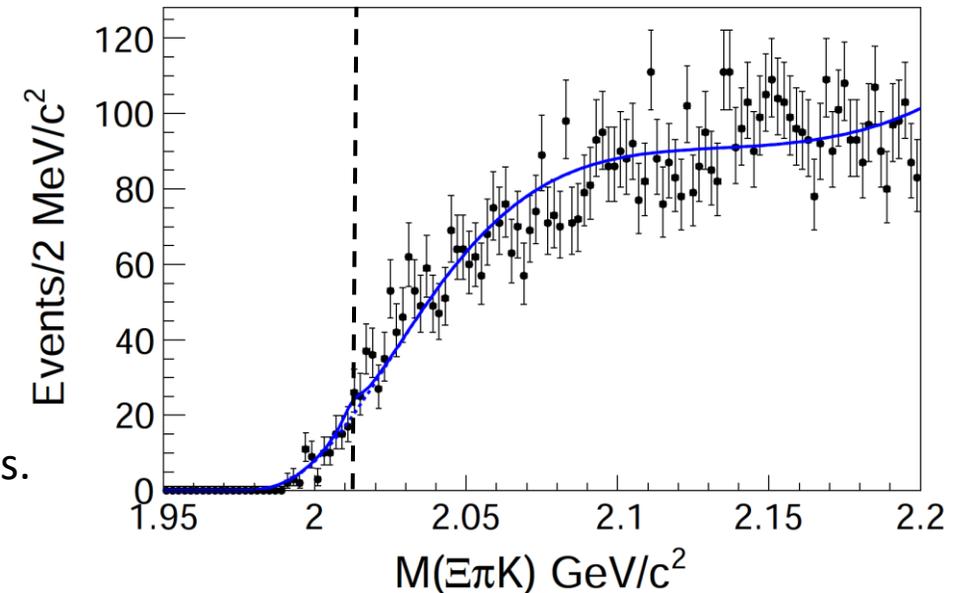

- There is no significant signal
- The upper limits on the ratio to Ξ -K decay are (stringent ones only):

$$\mathcal{R}_{\Xi^- \bar{K}^0}^{\Xi^- \pi^+ K^-} = \frac{\mathcal{B}(\Omega(2012) \rightarrow \Xi(1530)^0 (\rightarrow \Xi^- \pi^+) K^-)}{\mathcal{B}(\Omega(2012) \rightarrow \Xi^- \bar{K}^0)} < 9.3\%$$

$$\mathcal{R}_{\Xi^0 K^-}^{\Xi^- \pi^+ K^-} = \frac{\mathcal{B}(\Omega(2012) \rightarrow \Xi(1530)^0 (\rightarrow \Xi^- \pi^+) K^-)}{\mathcal{B}(\Omega(2012) \rightarrow \Xi^0 K^-)} < 7.8\%$$

- These values are contradicted/have tensions with many molecular scenarios.

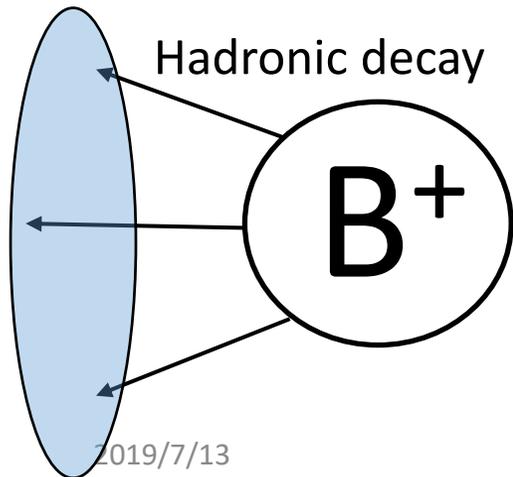

[arXiv:1906.00194](https://arxiv.org/abs/1906.00194)

Absolute branching fractions of $\Xi_c^{0/+}$

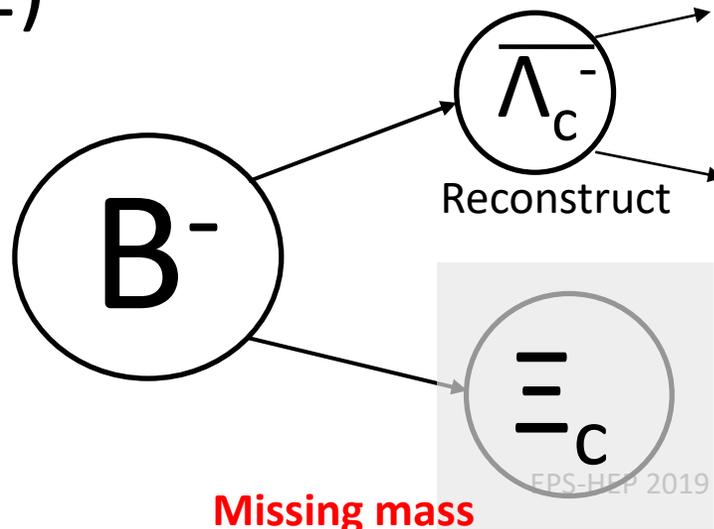

- Ξ_c decay branching fractions were all measured ONLY relative to primary modes.
 - Absolute values awaited to determine production cross sections/partial decay widths.
- Absolute values for
 - $\Xi_c^0 \rightarrow \Xi^- \pi^+, \Lambda K^- \pi^+, \rho K^- K^- \pi^+$ and $\Xi_c^+ \rightarrow \Xi^- \pi^+ \pi^-, \rho K^- \pi^+, \rho K^*$ are measured in the following way
 - 1): Measure $\text{Br}(B^{-/0} \rightarrow \Lambda_c^- \Xi_c^{0/+})$ using **missing mass**.
 - 2): Measure $\text{Br}(B^- \rightarrow \Lambda_c^- \Xi_c^{0/+}) \times \text{Br}(\Xi_c^0 \rightarrow f)$ by **exclusively reconstructing** Ξ_c
 - 3): Divide 2) by 1).

Results for Ξ_c^0

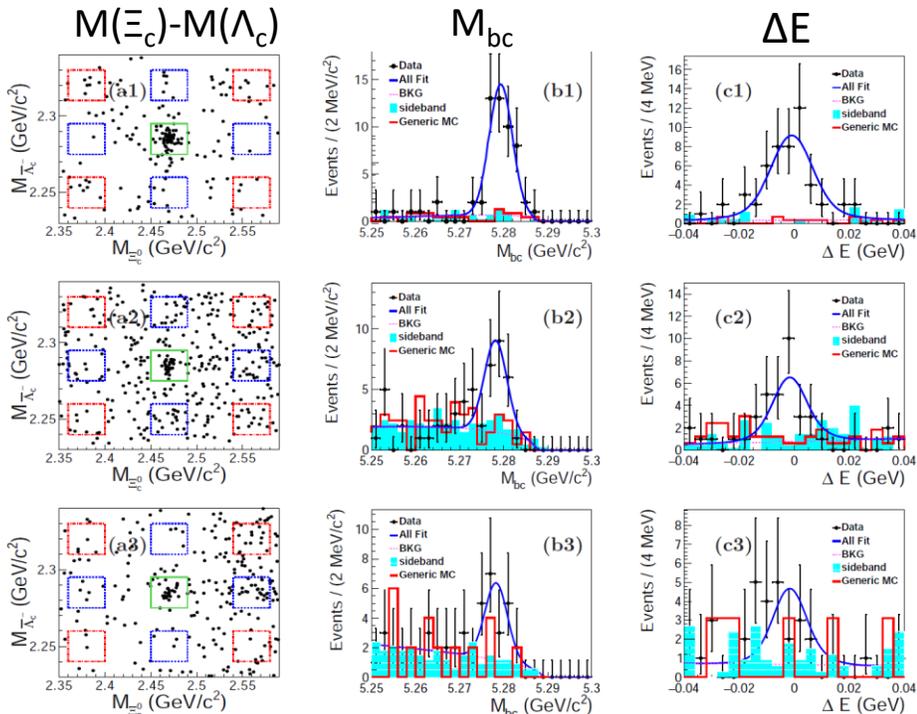

1)

[Phys. Rev. Lett. 122, 082001](#)

- Ξ_c^0 is observed by missing mass for the first time with 5.5σ (40.9 ± 9.0 events)
- $Br(B^- \rightarrow \Lambda_c^- \Xi_c^0) = (9.51 \pm 2.10 \pm 0.88) \times 10^{-4}$

2)

- 2 dimensional fit on $M_{bc} - \Delta E$ after selecting signal region in $M(\Xi_c^-) - M(\Lambda_c^-)$ plane.

$\Xi^- \pi^+$

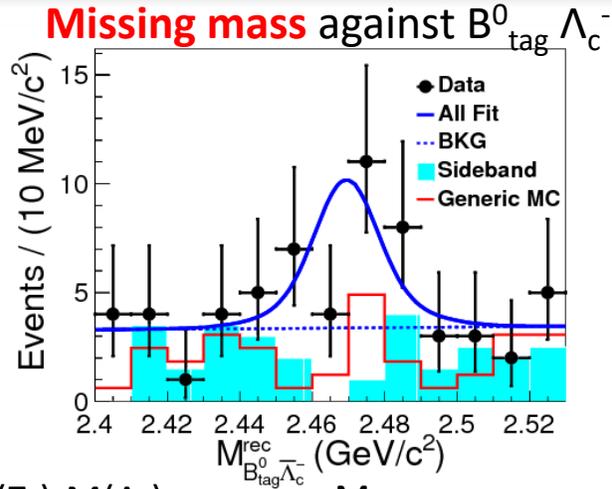

$\Lambda K^- \pi^+$

$\rho K^- K^- \pi^+$

3)

Decay	$Br(B \rightarrow \Xi_c \Lambda_c) \times Br(\Xi_c \rightarrow f)$ (10^{-5})	$Br(\Xi_c^0 \rightarrow f)$ (%)	Significance
$\Xi^- \pi^+$	$1.71 \pm 0.28 \pm 0.15$	$1.8 \pm 0.5 \pm 0.14$	9.5σ
$\Lambda K^- \pi^+$	$1.11 \pm 0.26 \pm 0.10$	$1.17 \pm 0.37 \pm 0.09$	6.8σ
$\rho K^- K^- \pi^+$	$0.547 \pm 0.178 \pm 0.057$	$0.58 \pm 0.23 \pm 0.05$	4.6σ

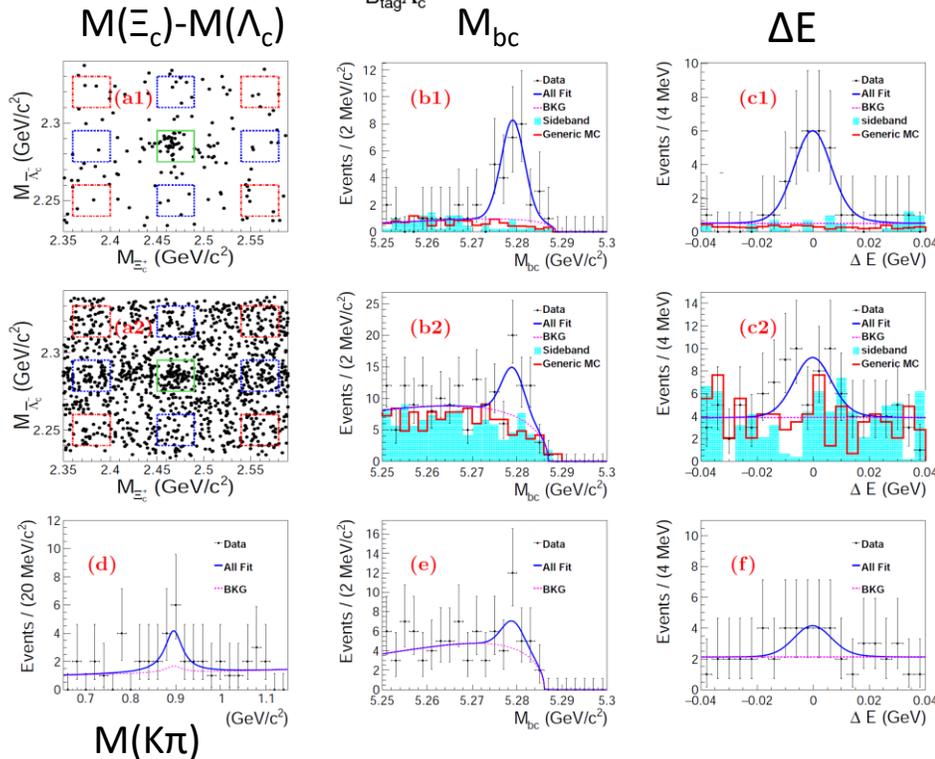

1)

[arXiv:1904.12093](https://arxiv.org/abs/1904.12093)

- Ξ_c^+ is observed by missing mass for the first time with 3.2σ (18.8 ± 6.8 events)
- $\text{Br}(B^0 \rightarrow \Lambda_c^- \Xi_c^+) = (1.16 \pm 0.42 \pm 0.15) \times 10^{-3}$

2)

- Signal yields are obtained by 2D fit on $M_{bc}-\Delta E$ after selecting signal region in $M(\Xi_c)-M(\Lambda_c)$ plane.

3)

$\Xi^- \pi^+ \pi^-$

$\rho K^- \pi^+$

ρK^*

Decay	$\text{Br}(B \rightarrow \Xi_c \Lambda_c) \times \text{Br}(\Xi_c \rightarrow f)$ (10^{-5})	$\text{Br}(\Xi_c^0 \rightarrow f)$ (%)	Significance
$\Xi^- \pi^+ \pi^-$	$3.32 \pm 0.74 \pm 0.33$	$2.86 \pm 1.21 \pm 0.38$	6.9σ
$\rho K^- \pi^+$	$5.27 \pm 1.51 \pm 0.69$	$0.45 \pm 0.21 \pm 0.07$	4.5σ
ρK^*	$2.96 \pm 1.31 \pm 0.44$	$0.25 \pm 0.16 \pm 0.04$	3.3σ

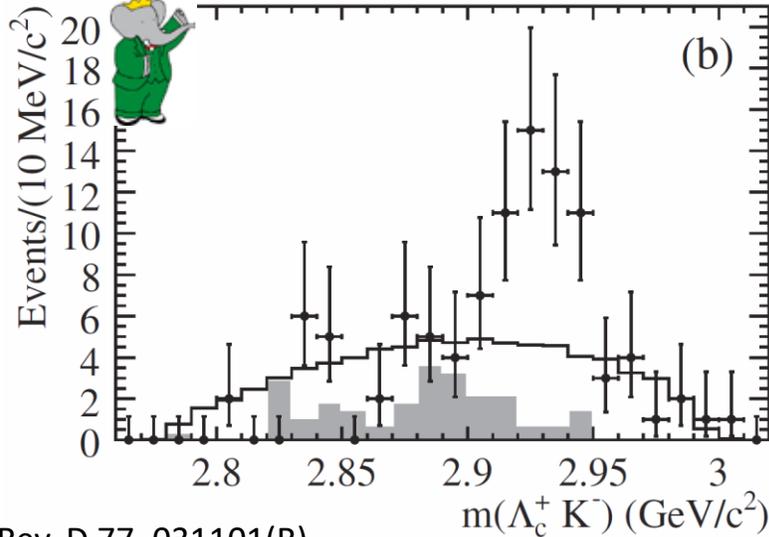

- After ~ 10 years from the end of data taking, Belle is actively working on the baryon spectroscopy.
- Variety of production mechanisms enabled various measurements.
- More studies with Belle data on going, and more data soon come from Belle II!

Observation of $\Xi_c(2930)^0$

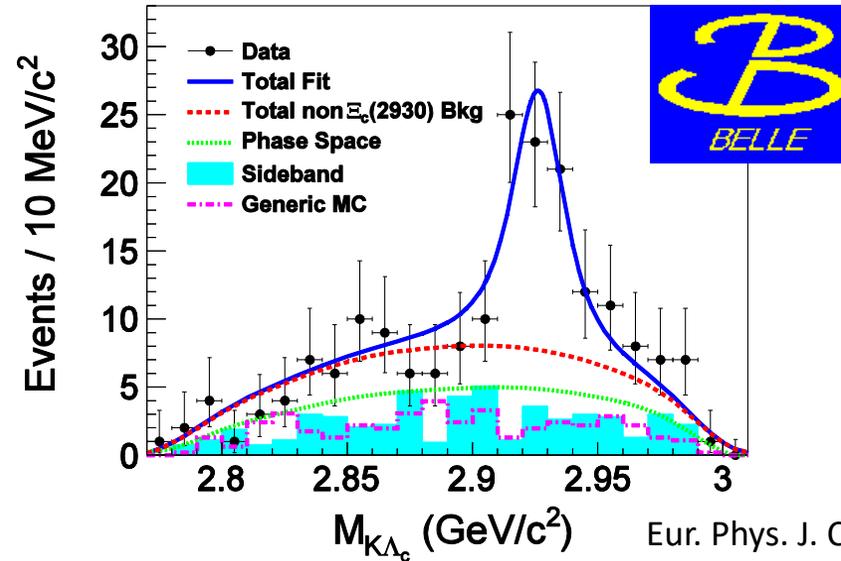

- Weak evidence of $\Xi_c(2930)$ was reported by BaBar in $B^- \rightarrow \Xi_c(2930)\bar{\Lambda}_c, \Xi_c(2930) \rightarrow \Lambda_c^+ K^-$
- Assigned as one star in PDG (need confirmation) .
- Belle performed the same study with ~ 3 times statistics.

Previous study by BaBar (2008)

Phys. Rev. D 77, 031101(R)

New study by Belle (2018)

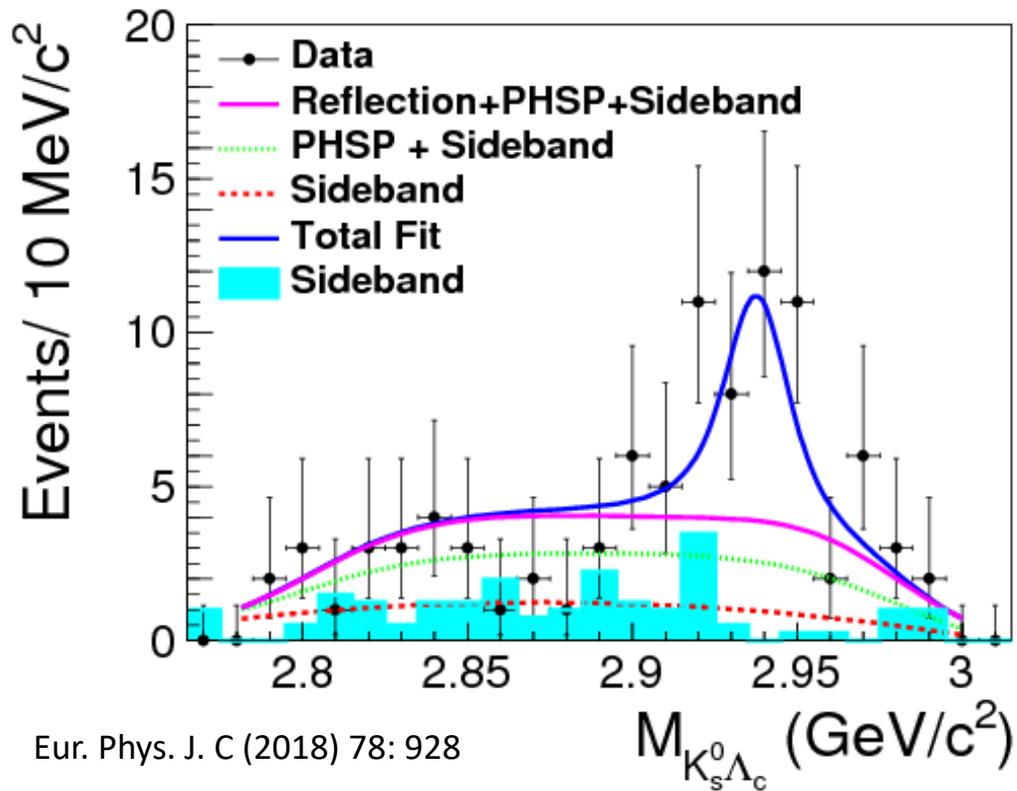

Eur. Phys. J. C (2018) 78: 252.

	Mass (MeV/c ²)	Width (MeV)
BaBar	$2931 \pm 3 \pm 5$	$36 \pm 7 \pm 11$
Belle	$2928.9 \pm 3.0^{+0.8}_{-12.0}$	$19.5 \pm 8.4^{+5.4}_{-7.9}$

- The statistical significance of the peak at Belle is 5.1σ .
- Mass and width are consistent each other

Evidence for charged partner $\Xi_c(2930)^+$

Belle also found **4.1 σ** evidence for charged partner $\Xi_c(2930)^+$ in $B^0 \rightarrow \Xi_c(2930)^+ \Lambda_c^-$, $\Xi_c(2930)^+ \rightarrow \Lambda_c^+ K_{S0}$

	Mass (MeV/c ²)	Width (MeV)
$\Xi_c(2930)^0$	$2928.9 \pm 3.0^{+0.8}_{-12.0}$	$19.5 \pm 8.4^{+5.4}_{-7.9}$
$\Xi_c(2930)^+$	$2942.3 \pm 4.4 \pm 1.5$	$14.8 \pm 8.8 \pm 2.5$

Eur. Phys. J. C (2018) 78: 928

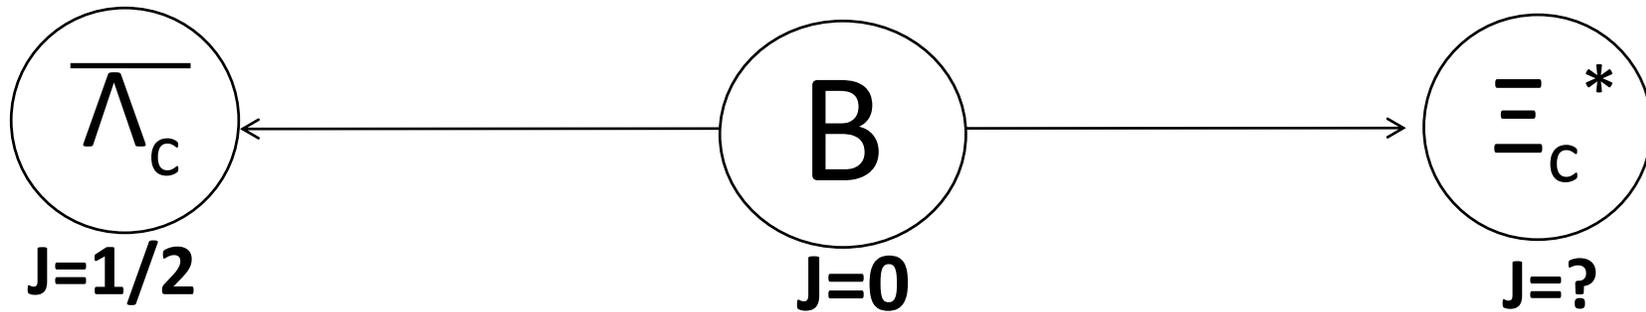

Some comments on $\Xi_c(2930)$

- $\Xi_c(2930)^0$ is the first charmed baryon established in the B-decay.

$M(\Lambda_c^+K^-)$ in $e^+e^- \rightarrow c\bar{c}$ by BaBar.

- As it is two-body B-decay, spin can be determined un-ambiguously from helicity constraint if we have enough statistics.

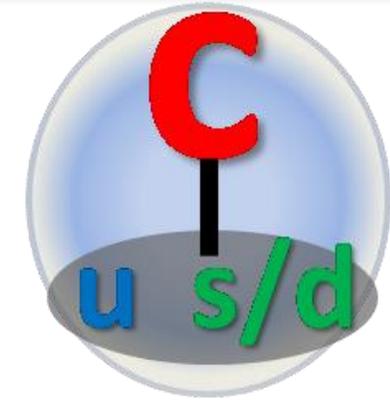

$J_z = 1/2$

(1) Di-quark structure in the baryon

- Spin-spin interaction $\propto 1/m_1 m_2$
- Di-quark + charm quark
 - Di-quark as new degree of freedom.
 - Easier to understand baryons.

Nucleon

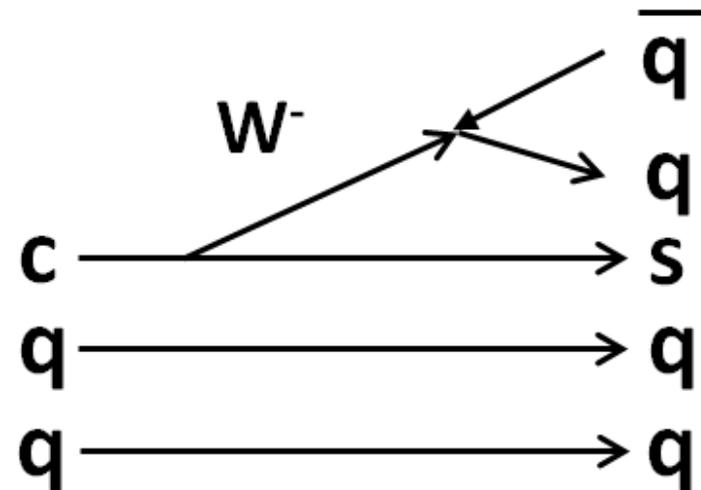

Charmed baryon

Pairs can not be distinguished. Light di-quark and charm quark.

(2) Charm baryon as a hyperon laboratory

- Ground-state dominantly decay via $c \rightarrow s$.
- Variety of hyperons are produced.

Currently observed charmed baryons
