## Measurements of the top quark mass using the ATLAS detector at the LHC

*Thursday 11 July 2019 10:45 (15 minutes)*

The latest measurements of the top quark mass using the ATLAS experiment are presented. A measurement based on a multi-dimensional template fit that can constrain the uncertainties on the energy measurements of jets is presented and combined with measurements using dilepton and all-hadronic events. In addition, an analysis of the top quark mass using leptonic kinematic variables is discussed. The measurement uses a novel technique to measure the top quark mass with minimal dependence on hadronic jets. The measurements that use precision theoretical QCD calculations for both inclusive  $t\bar{t}$  production and  $t\bar{t}$  production with an additional jet to extract the top quark mass in the pole-mass scheme are also presented.
